OBJECT MANAGEMENT GROUP

XTCE

XML Telemetry & Command Exchange

An International (OMG) Standard Language
for the Description of Mission Operations
Databases

Credits

OBJECT MANAGEMENT GROUP

- Key Design Team
 - European Space Agency
 - Science Systems – Sam Cooper, Roger Thompson
 - ESOC – Mario Merri
 - US Air force/Mission Operations
 - USAF SMC Det 12/VO (Lockheed Martin) – Gerry Simon
 - Boeing Communications & Satellites
 - Janice Champion
 - NASA
 - GSFC – Mike Rackley
 - GST – Kevin Rice
 - Raytheon TSC / UMD – Ed Shaya

More Credits

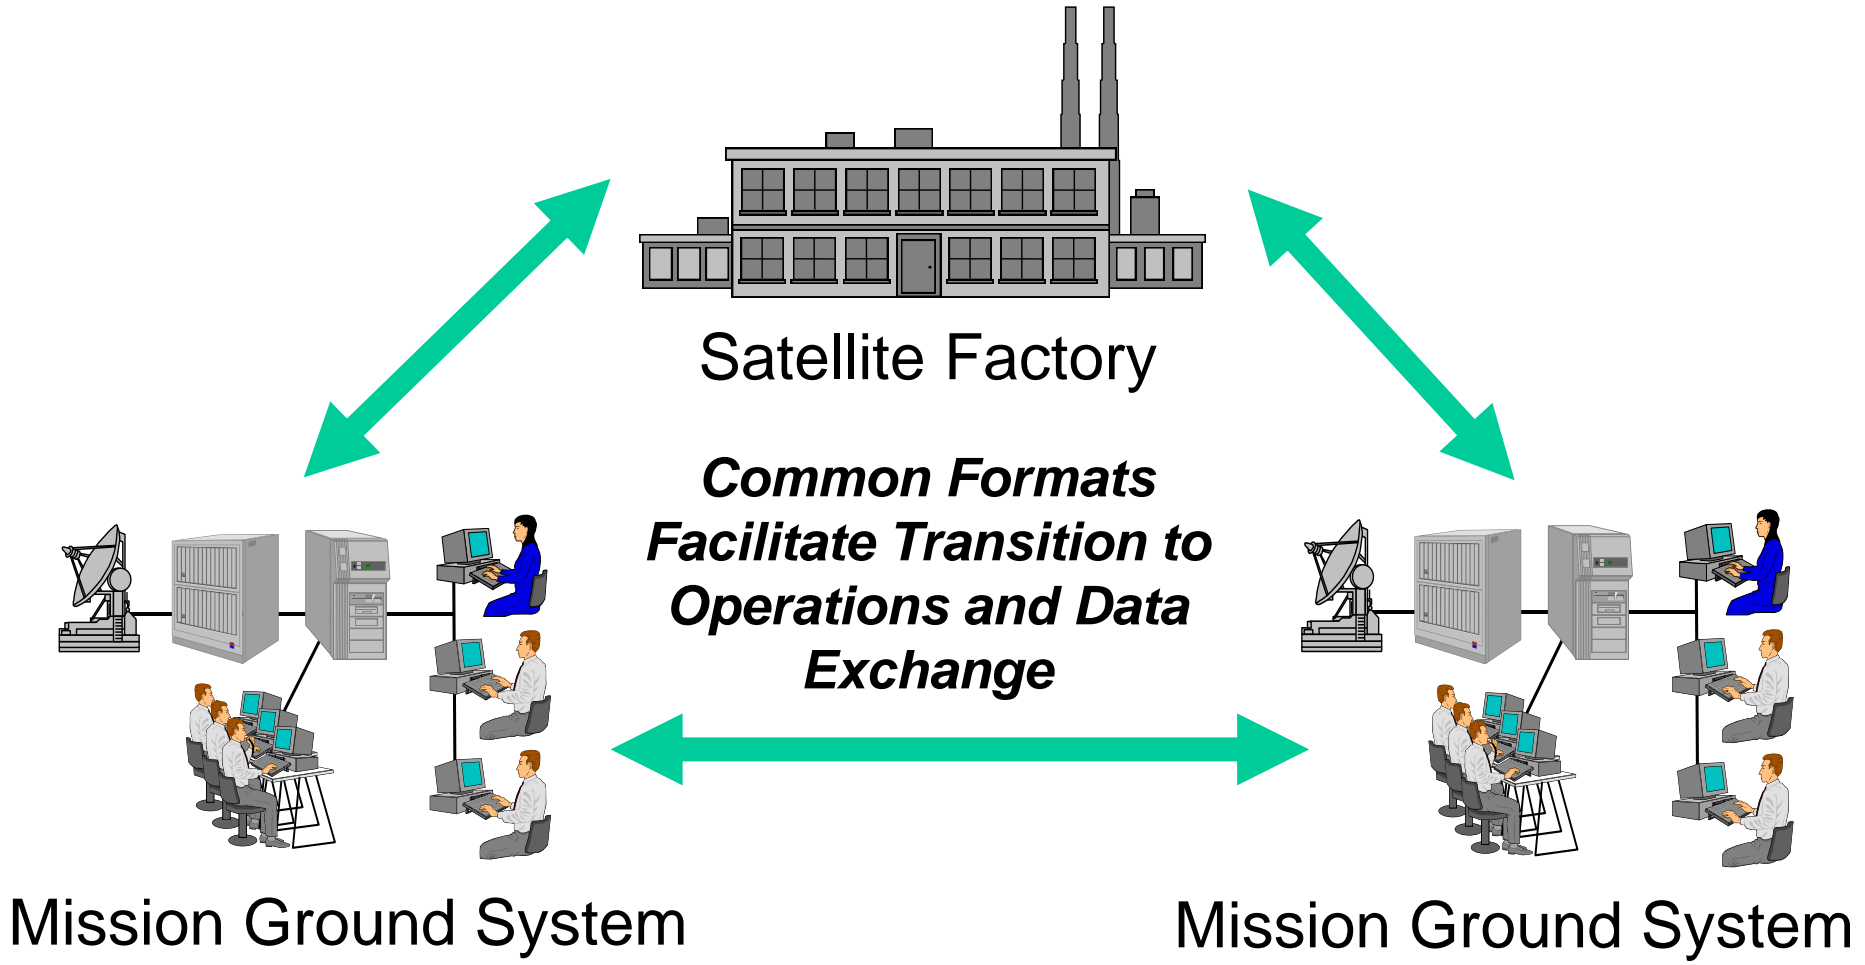

OBJECT MANAGEMENT GROUP

- **OMG Space Domain Task Force**
 - Joan Dunham (CSC)(OMG Co-chair)
 - Mark Brucks (J3S)
 - Jeff Condron (GSFC/Raytheon)
 - Greg Greer (GSFC/Hammers)
 - Priscilla McKerracher (APL)
 - Peter Shames (JPL)
 - Brad Kizzort (Harris)

Vision

OBJECT MANAGEMENT GROUP

Basic Concepts

OBJECT MANAGEMENT GROUP

- **What**: Non-proprietary standard description language of T&C parameters and commands for exchange between manufacturers, vendors, testers and operators.
- **Why**: Common format reduces human error, ambiguities, confusion, and lost time in difficult, sometimes lossy, conversions between systems.
 - Save money per mission
 - Reduce mission readiness schedule
 - Better, Faster, Cheaper
- **How**:
 - Common usage of XML to tag information.
 - Greater machine understanding and automation.

Background - Object Management Group (OMG)

OBJECT MANAGEMENT GROUP

- Consortium of ~600 international software companies (Lockheed Martin, IBM, Sun, MS, Borland, etc)
- Standards Organization for CORBA and UML among others. Developed XSI, the XML standard for UML modeling.
- Subdivided by Technology/Industries into platform/domain task forces.
- Meets 5 times per year.
- Tasks Forces
 - Issue Request for Information/Proposal (RFI, RFP) for specifications.
 - Receives responses, then creates a candidate specification.
 - Ultimately OMG Architecture Board (votes) recommends specification.

Background - Space Domain Task Force (SDTF)

OBJECT MANAGEMENT GROUP

- The Space Domain Task Force (SDTF) is an OMG vertical Domain Task Force (DTF) specifically chartered to foster the development of space related standards because:

space applications ***MUST*** interoperate better

- Space professionals committed to greater interoperability, reduction in costs, schedule, and risk for space applications through increased standardization
- The SDTF has been working cooperatively with the CCSDS to ensure consistent space standards development.

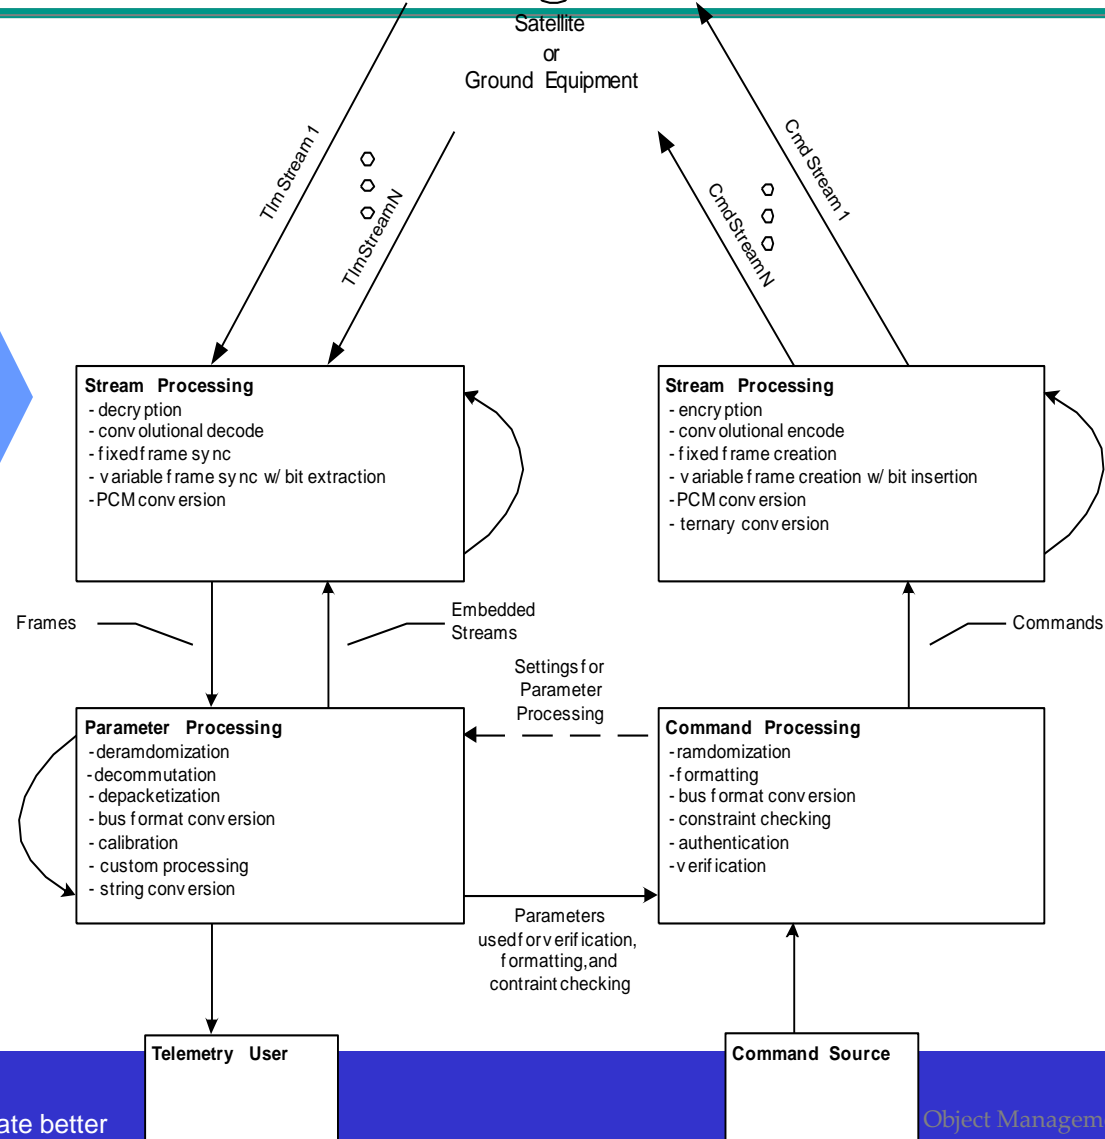

OBJECT MANAGEMENT GROUP

XTCE - XML Telemetric Command Exchange format

Satellite
or
Ground Equipment

XTCE Encapsulates the data required to perform all this processing

A Little About XML

OBJECT MANAGEMENT GROUP

- XML is simply:
 <TAG> *data* <\TAG>, where *data* is:
 <TAG> *more data* <\TAG>, etc...
- XML is designed to *carry data* – W3C
- *Example:*

<note>

<to>Tove</to>

<from>Jani</from>

<heading>Reminder</heading>

<body>Don't forget me this weekend!</body>

</note>

From XML to XML Schema

OBJECT MANAGEMENT GROUP

- XML Schema is a LANGUAGE builder for building an information model in XML – a meta-model
- Once you define YOUR Schema, you can build a parser to ingest XMLs. If it accepts the XML, the XML in YOUR Schema... (it's valid)
- If the XML is in your language, you can then get data into or out of it, after parsing

OBJECT MANAGEMENT GROUP

A Schema for the Last XML Example

```
<?xml version="1.0"?>
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema"
targetNamespace=http://www.w3schools.com
xmlns="http://www.w3schools.com"
elementFormDefault="qualified">

  <xs:element name="note">
    <xs:complexType>
      <xs:sequence>
        <xs:element name="to" type="xs:string"/>
        <xs:element name="from" type="xs:string"/>
        <xs:element name="heading" type="xs:string"/>
        <xs:element name="body" type="xs:string"/>
      </xs:sequence>
    </xs:complexType>
  </xs:element>
</xs:schema>
```

What Does XTCE Do? Data ... MetaData

OBJECT MANAGEMENT GROUP

Data	Description	
W3C - Schema	Meta Meta Meta Data – An XML Documents (W3C Schema Language) that describes the format of itself	<i>Created by the W3C</i>
XTCE – Schema	Meta Meta Data – An XML Document (W3C Schema Language) that describes the XTCE format	<i>Created by the SDTF</i>
XML in XTCE format	Meta Data – An XML Document (XTCE format) that describes the Data	<i>Created for a S/C program</i>
Streams, Containers, Parameters & Commands	Data – Actual streams of bits containing packages of parameters or commands	<i>Created by the S/C, Ground System or Simulator</i>

TrivalSat Example

OBJECT MANAGEMENT GROUP

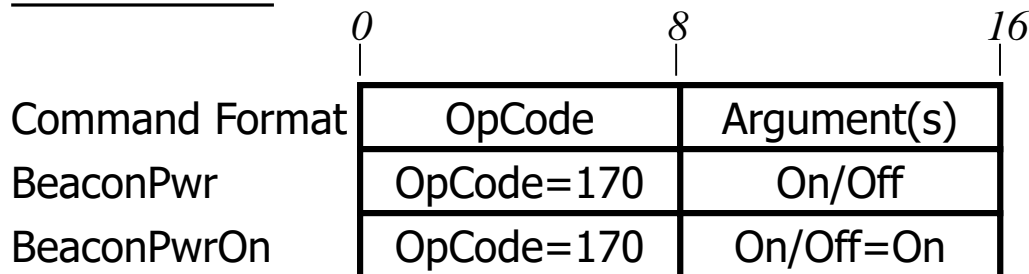

Telemetry

Bat1V – Battery one voltage, encoded as an 8 bit unsigned integer, MSB first, calibrated to a linear 0 to 32 volt curve

BeaconStatus – Beacon Status, encoded as an 8 bit unsigned integer, MSB first where only the first bit is used, that is treated as a enumerated type where a 1=On and 0=Off.

Command

Steps to Building the XML

OBJECT MANAGEMENT GROUP

1. Define a TrivialSat SpaceSystem

TelemetryMetaData

2. Define TelemetryParameterTypes

3. Instantiate Parameters using ParameterTypes

4. Build Sequence Containers

CommandMetaData

5. Define ArgumentTypes

6. Define MetaCommands

7. Define CommandContainers

OBJECT MANAGEMENT GROUP

Quick Notes to help understand the XML

- 'Meta' – means description. Example MetaCommand is a description of a Command.
- 'Set' – is an unordered collection
- 'List' – is an ordered collection
- 'Ref' – is a reference (by name) to an object defined elsewhere in the XML document

Step 1: TrivialSat - SpaceSystem

OBJECT MANAGEMENT GROUP

XML Standard

Default namespace

<?xml version="1.0" encoding="UTF-8"?>

<SpaceSystem xmlns="http://www.omg.org/space/xtce" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:schemaLocation="http://www.omg.org/space/xtce SpaceSystemV1.0.xsd" name="TrivialSat">

Schema location

SpaceSystem name

<TelemetryMetaData>

<ParameterTypeSet></ParameterTypeSet>

<ParameterSet></ParameterSet>

<ContainerSet></ContainerSet>

Telemetry description goes here

</TelemetryMetaData>

<CommandMetaData>

Command description goes here

<ArgumentTypeSet></ArgumentTypeSet>

<ParameterMetaCommandSet></MetaCommandSet>

<CommandContainerSet></CommandContainerSet>

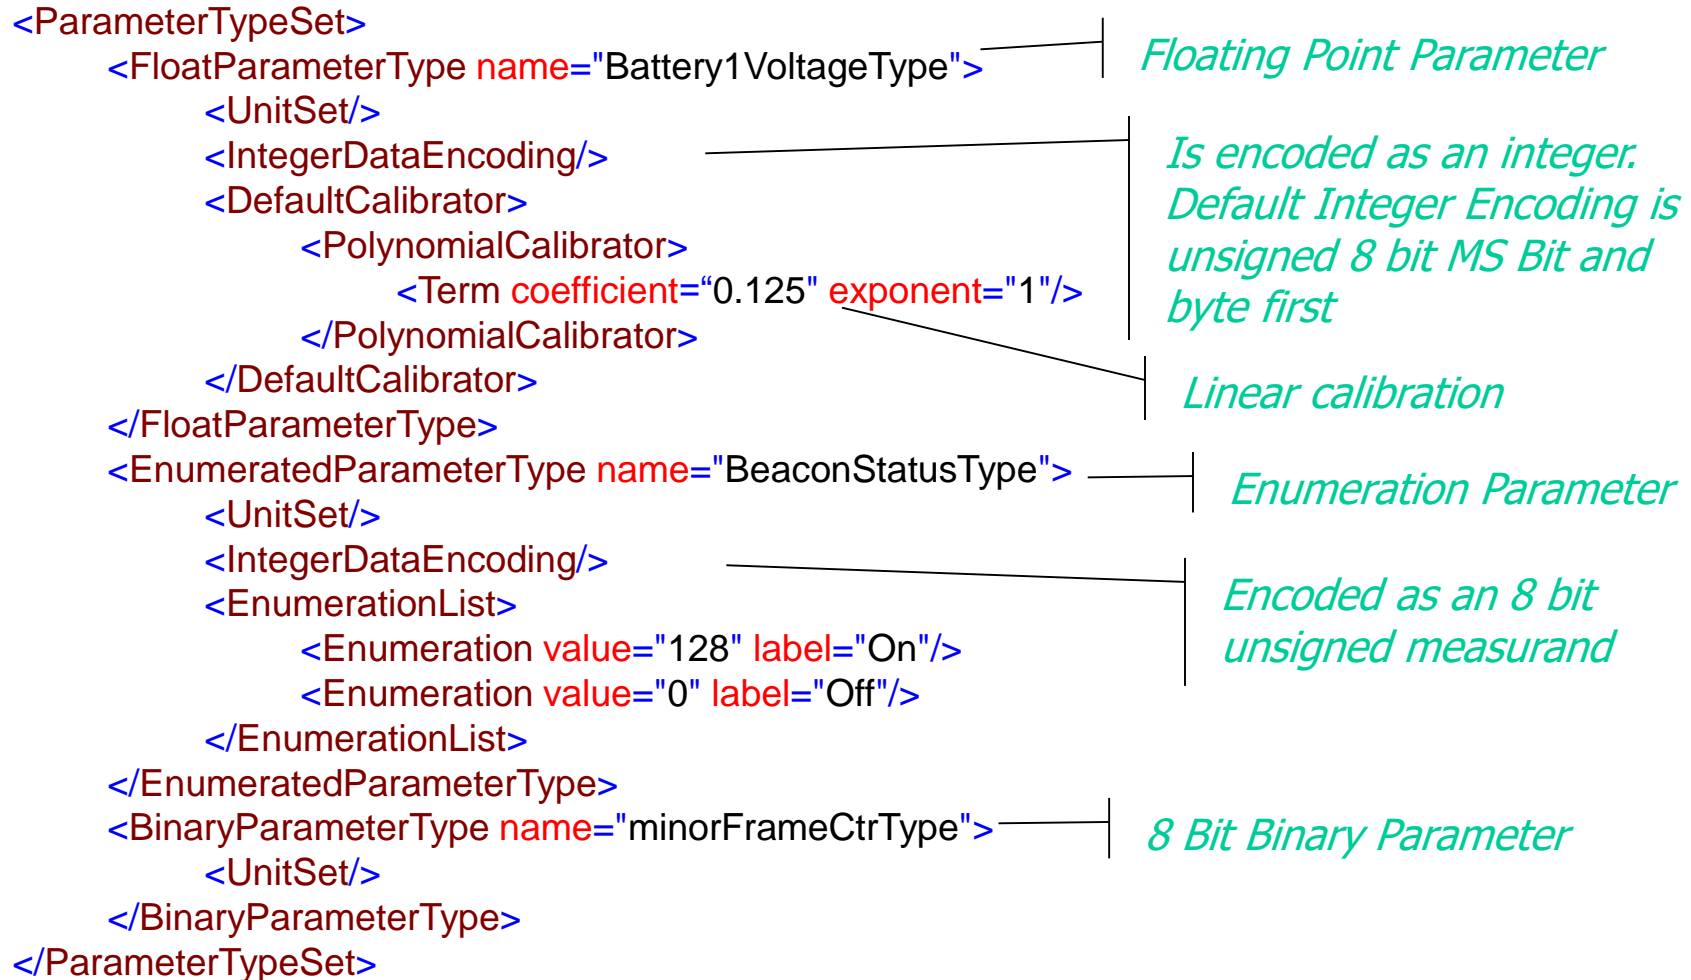

</CommandMetaData>

</SpaceSystem>

Step 2: TrivialSat – ParameterTypeSet

OBJECT MANAGEMENT GROUP

Step 3: TrivialSat - ParameterSet

OBJECT MANAGEMENT GROUP

<ParameterSet>

<Parameter name="BatteryVoltage" parameterTypeRef="BatteryVoltageType"/>

<Parameter name="BeaconStatus" parameterTypeRef="BeaconStatusType"/>

<Parameter name="minorFrameCtr" parameterTypeRef="minorFrameCtrType"/>

</ParameterSet>

Parameter will be of this type

Declare a Parameter with this name

Step 4: TrivialSat – ContainerSet

OBJECT MANAGEMENT GROUP

```
<ContainerSet>
  <SequenceContainer name="MinorFrame">
    <EntryList>
      <ParameterRefEntry parameterRef="minorFrameCtr"/>
    </EntryList>
  </SequenceContainer>
  <SequenceContainer name="MinorFrame0">
    <EntryList>
      <ParameterRefEntry parameterRef="Battery1Voltage"/>
      <ParameterRefEntry parameterRef="BeaconStatus"/>
    </EntryList>
    <Base containerRef="MinorFrame">
      <RestrictionCriteria>
        <Comparison parameterRef="minorFrameCtr" value="0x00"/>
      </RestrictionCriteria>
    </Base>
  </SequenceContainer>
  <SequenceContainer name="MinorFrame1">
    ....
  </SequenceContainer>
</ContainerSet>
```

Abstract MinorFrame

MinorFrame0

IS A MinorFrame

Where the minorFrameCtr = 0

Step 5: TrivialSat - ArgumentTypes

OBJECT MANAGEMENT GROUP

```
<ArgumentTypeSet>
  <BinaryArgumentType name="opCodeType">
    <UnitSet/>
  </BinaryArgumentType>
  <EnumeratedArgumentType name="onOffType">
    <UnitSet/>
    <EnumerationList>
      <Enumeration value="1" label="on"/>
      <Enumeration value="0" label="off"/>
    </EnumerationList>
  </EnumeratedArgumentType>
</ArgumentTypeSet>
```

OBJECT MANAGEMENT GROUP

Step 6: TrivialSat – MetaCommand: Top level MetaCommand

```
<MetaCommand name="TrivialSatCmdType" abstract="true">
```

```
  <ArgumentList>
```

```
    <Argument name="opCode" argumentTypeRef="opCodeType"/>
```

```
  </ArgumentList>
```

```
  <CommandContainer name="TrivialSatCommandContainerType">
```

```
    <EntryList>
```

```
      <ArgumentRefEntry argumentRef="opCode"/>
```

```
    </EntryList>
```

```
  </CommandContainer>
```

```
</MetaCommand>
```

Abstract TrivialSatCmd – only has an opCode

TrivialSat – MetaCommand: BeaconPwr

OBJECT MANAGEMENT GROUP

```
<MetaCommand name="BeaconPwr">
  <LongDescription>Turn Beacon Power on or off</LongDescription>
  <BaseMetaCommand metaCommandRef="TrivialSatCmdType">
    <ArgumentAssignmentList>
      <ArgumentAssignment argumentName="opCode" argumentValue="170"/>
    </ArgumentAssignmentList>
  </BaseMetaCommand>
  <ArgumentList>
    <Argument name="powerValue" argumentTypeRef="onOffType"/>
  </ArgumentList>
  <CommandContainer name="BeaconPwr">
    <EntryList>
      <ArgumentRefEntry argumentRef="powerValue"/>
    </EntryList>
    <BaseContainer containerRef="TrivialSatCmdContianerType">
  </BaseContainer>
</CommandContainer>
</MetaCommand>
```

Value of opCode is fixed for this MetaCommand type

New argument introduced

MetaCommand container – the powerValue argument is added to the container

Details

OBJECT MANAGEMENT GROUP

- The remainder of this presentation covers details of the XTCE specification

XTCE: Simple to Complex

OBJECT MANAGEMENT GROUP

- XTCE is designed to describe 90% of the data required for 95% of spacecraft missions
- XTCE for simple data formats is simple
- XTCE for esoteric data formats is not simple
- Pages in this presentation that discuss some of the more esoteric concepts have darker backgrounds

Parameters

The ParameterSet holds the definition of all the parameters of interest for this SpaceSystem. Parameters can be anything from header information, engineering values to sensor info, etc...

Simple Case

```
<IntegerParameter name="grdCommandCtr">
  <UnitDef/>
</IntegerParameter>
```

OMG Space Domain Task Force
See also: www.omg.org/standards/HSST/interoperability

Alarms - ContextAlarms

- Oftentimes Alarm ranges need to change as the SV enters different phases (factory test, on-orbit) or enters different operating modes (eclipse, LEO, safe-mode).
- These are all collectively called 'Contexts'
- Parameters have an optional ContextAlarmList
- Alarms from the first Context in the ContextAlarmList to test true are applied.

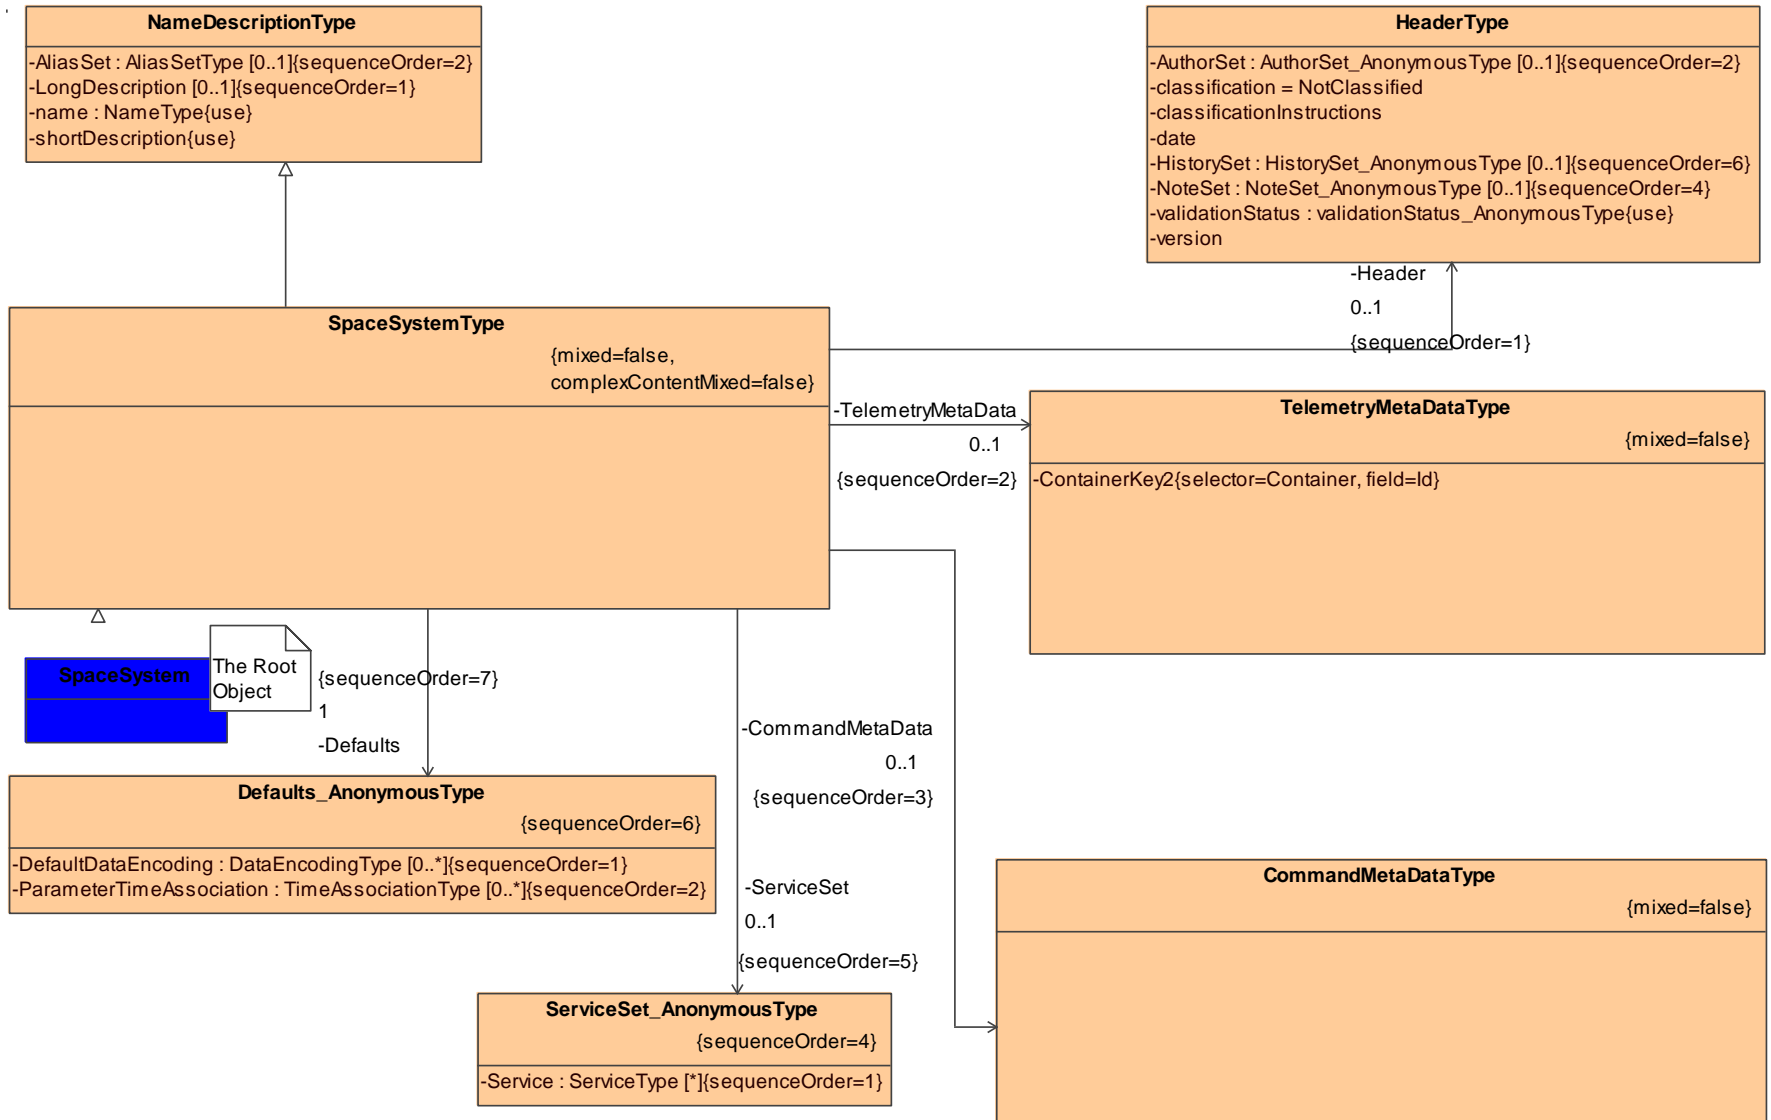

OMG Space Domain Task Force
See also: www.omg.org/standards/HSST/interoperability

Alarms - User Algorithm

OMG Space Domain Task Force
See also: www.omg.org/standards/HSST/interoperability

XTCE Top Level UML

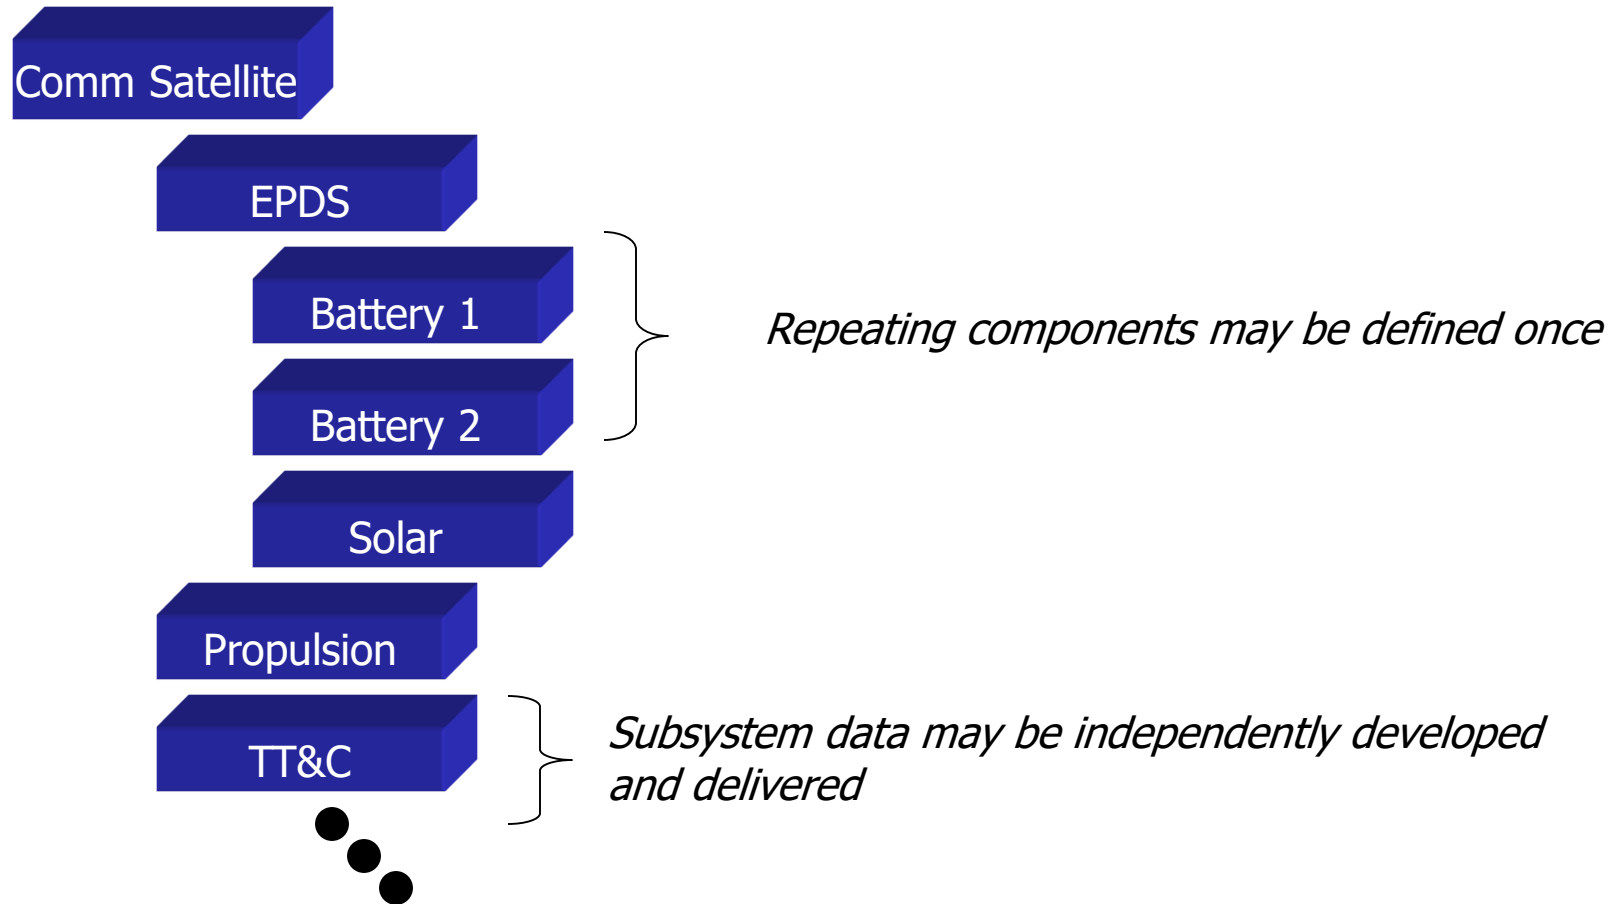

OBJECT MANAGEMENT GROUP

What's With this Systems-of-Systems Thing?

- XTCE's hierarchical structure looks like a real spacecraft

More on the hierarchy

OBJECT MANAGEMENT GROUP

- Hierarchy may start at any level

XTCE Top Level in XML

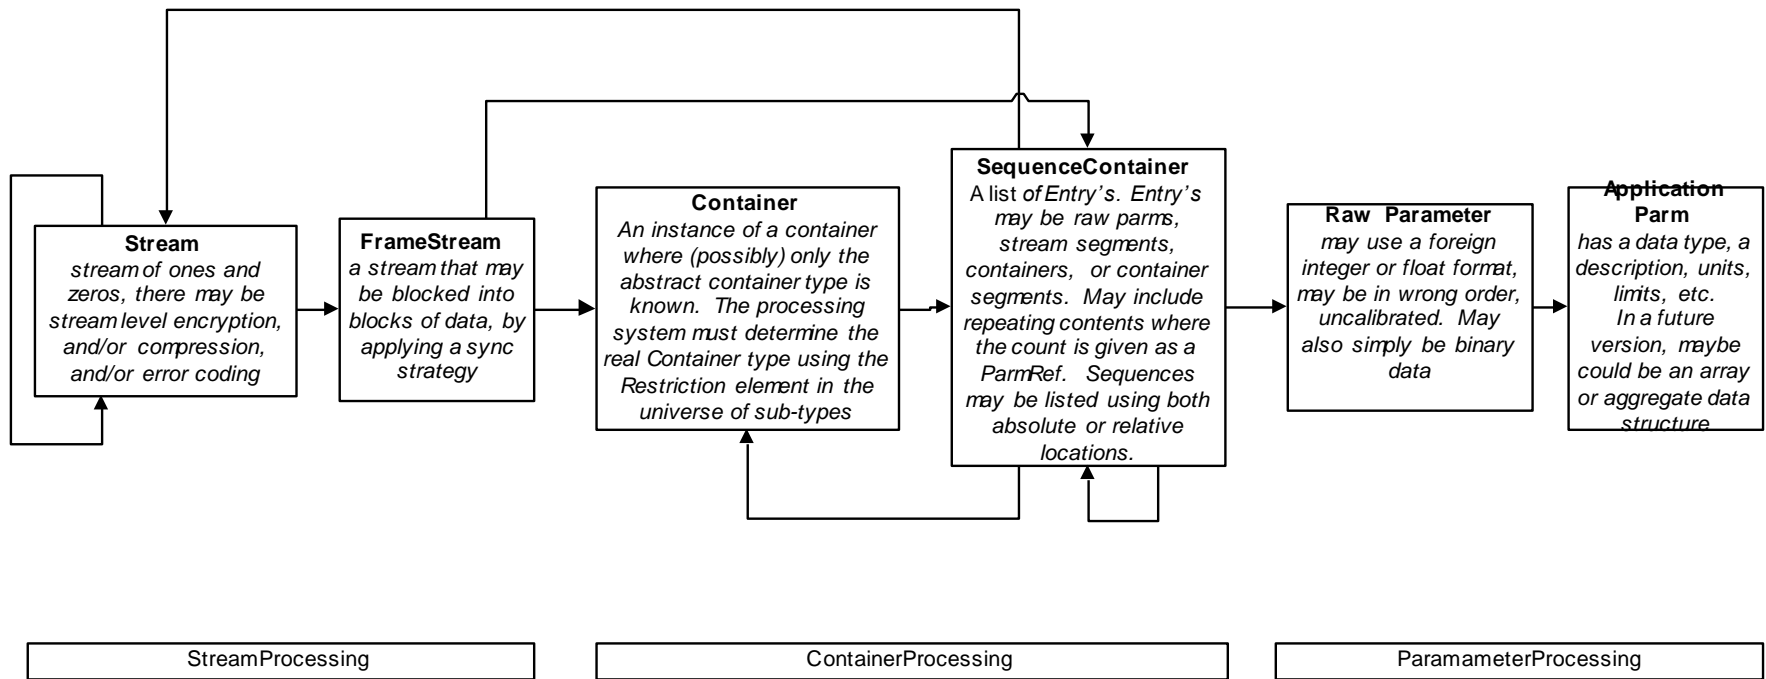

OBJECT MANAGEMENT GROUP

```
<?xml version="1.0" encoding="UTF-8"?>
<SpaceSystem xmlns="http://www.omg.org/space/xtce" xmlns:xsi="http://www.w3.org/2001/XMLSchema-
instance" xsi:schemaLocation="http://www.omg.org/space/xtce SpaceSystem.xsd" name="Camera">
  <TelemetryMetaData>
    <ParameterSet>
      <BinaryParameter name="colorImage">
        <UnitSet/>
        <BinaryDataEncoding>
          <SizeInBits>
            <FixedDecimalValue>1000000</FixedDecimalValue>
          </SizeInBits>
        </BinaryDataEncoding>
      </BinaryParameter>
    </ParameterSet>
  </TelemetryMetaData>
</SpaceSystem>
```

Telemetry Processing Flow

OBJECT MANAGEMENT GROUP

ParameterTypeSet

OBJECT MANAGEMENT GROUP

- The ParameterTypeSet holds the definition of all the parameters of interest for this SpaceSystem. ParameterTypes can be anything from header information, engineering values to sensor info, etc...
- Parameter types: Integer, Float, String, Enumeration, Binary, Absolute Time, Relative Time, Array and Boolean
- Simple Case

```
<IntegerParameterType name="grdCommandCtr_t">  
  <UnitSet/>  
</IntegerParameterType>
```

ParameterTypes and Parameters

OBJECT MANAGEMENT GROUP

- ParameterTypes are instantiated as Parameters. Parameters can have a value; it is not the value itself
- Parameters types indicate how the parameter is to be handled on the ground
- Integer (32, 64 or 128 bit)
- Float (32, 64 or 128 bit)
- Binary (any size)
- String (any size)
- Enumerated – has a list of numerical values each with a matching strings
- RelativeTime – an elapsed time value (precision is not currently specified)
- AbsoluteTime – time referenced to a fixed epoch

OBJECT MANAGEMENT GROUP

ParameterType – Example XML

```
<BinaryParameterType name="frameSyncType" shortDescription="Frame Synchronization Field"
initialValue="0934">
```

```
  <LongDescription><![CDATA[This long description for frame sync contains an <b>HTML</b>markup
description]]></LongDescription>
```

```
  <UnitSet/>
```

```
  <BinaryDataEncoding bitOrder="mostSignificantBitFirst">
```

```
    <SizeInBits>
```

```
      <FixedDecimalValue>13</FixedDecimalValue>
```

```
    </SizeInBits>
```

```
  </BinaryDataEncoding>
```

```
</BinaryParameterType>
```

Parameter – Example XML

OBJECT MANAGEMENT GROUP

```
<Parameter name="frameSyncType" parameterTypeRef="frameSyncType" shortDescription="Frame  
Synchronization Field">  
  <ParameterProperties dataSource="telemetered" readOnly="true"/>  
</Parameter>
```

Parameter Properties

OBJECT MANAGEMENT GROUP

- **dataSource** – telemetered, derived, constant, local
- **readOnly**
- **SystemName**
Optional. Normally used when the database is built in a flat, non-hierarchical format
- **ValidityCondition**
Optional condition that must be true for this Parameter to be valid
- **PhysicalAddressSet**
Contains the address (e.g., channel information) required to process the spacecraft telemetry streams. May be an onboard id, a mux address, or a physical location.
- **TimeAssociation**
See discussion on following page

TimeAssociation

OBJECT MANAGEMENT GROUP

- Telemetry parameter instances are oftentimes "time-tagged" with a timing signal either provided on the ground or on the space system. This data element allows one to specify which AbsoluteTimeParameters to use to "time-tag" instances of this Parameter with.
- TimeAssociation is a special case of ParameterInstanceRef that also includes a flag 'interpolateTime' that indicates whether the actual value should be used or if the value of the ParameterInstanceRef should be adjusted to reflect the probable time elapsed.

TimeAssociation cont.

OBJECT MANAGEMENT GROUP

- Time values are typically built up from one or more separate Parameter instances starting with least significant and working towards most significant

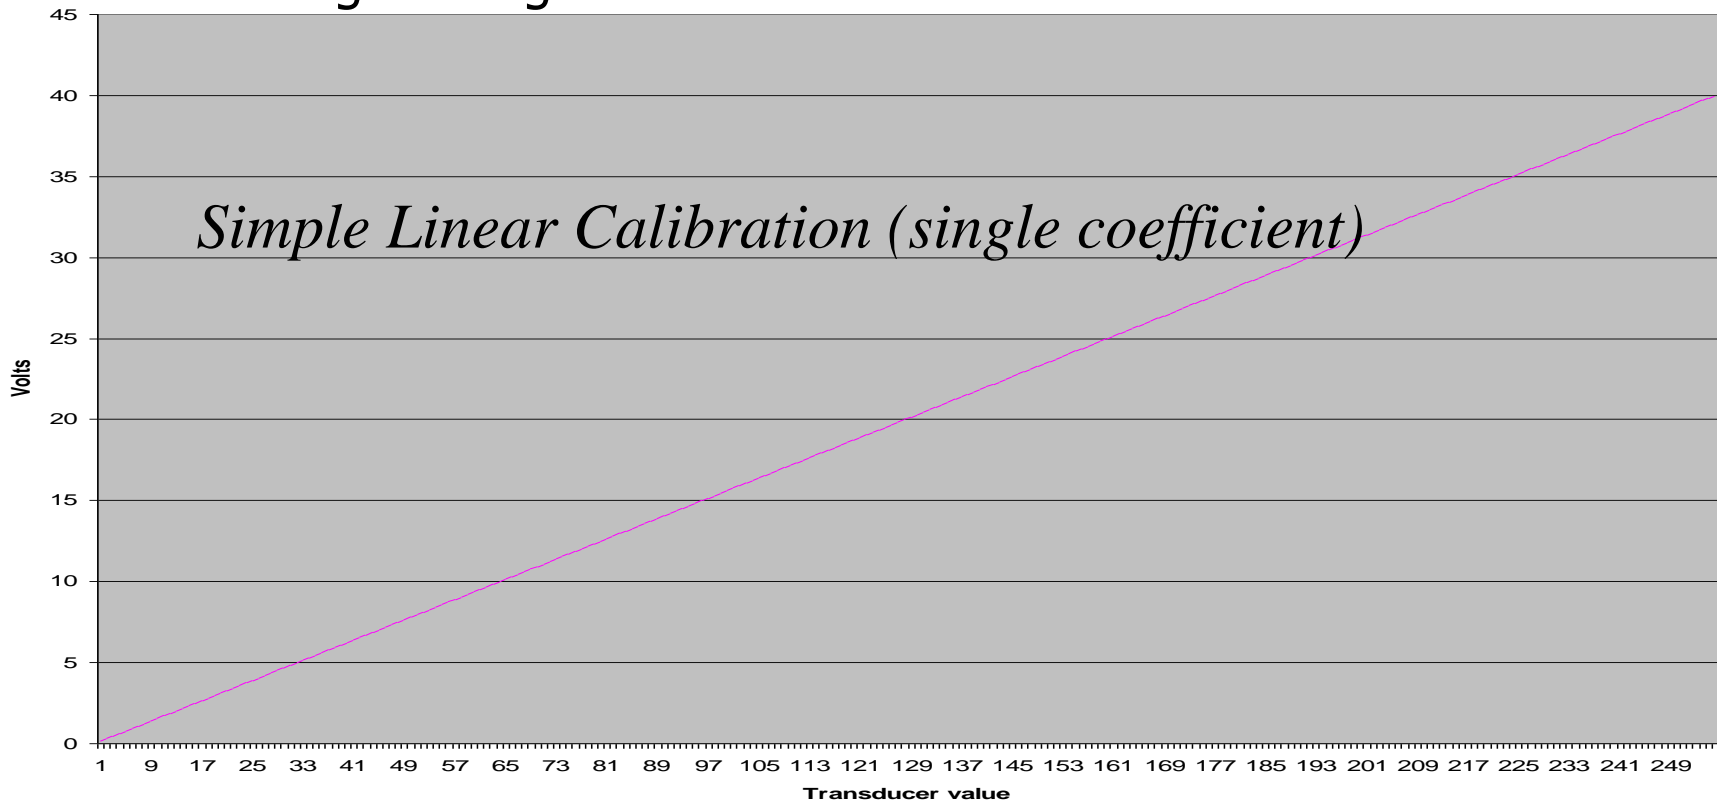

Calibrators

OBJECT MANAGEMENT GROUP

- Sensors errors on the spacecraft plus the need to 'compress' data for transmission result in a need to 'calibrate' incoming telemetry data into usable engineering data.

Calibrators – Two Types

OBJECT MANAGEMENT GROUP

- Polynomial, any number of coefficients

$$Y = C_0 + C_1x + C_2X^2 \dots + C_NX^N$$

Where Y is the calibrated value and x is the uncalibrated value

- Spline, segmented curve, arbitrary order

- 1st Order is a set of line segments
- 2nd Order is a set of quadratic segments
- 3rd Order is a set of cubic segments
- Etc.
- 1st Order is the default

Calibrators – Default and Context

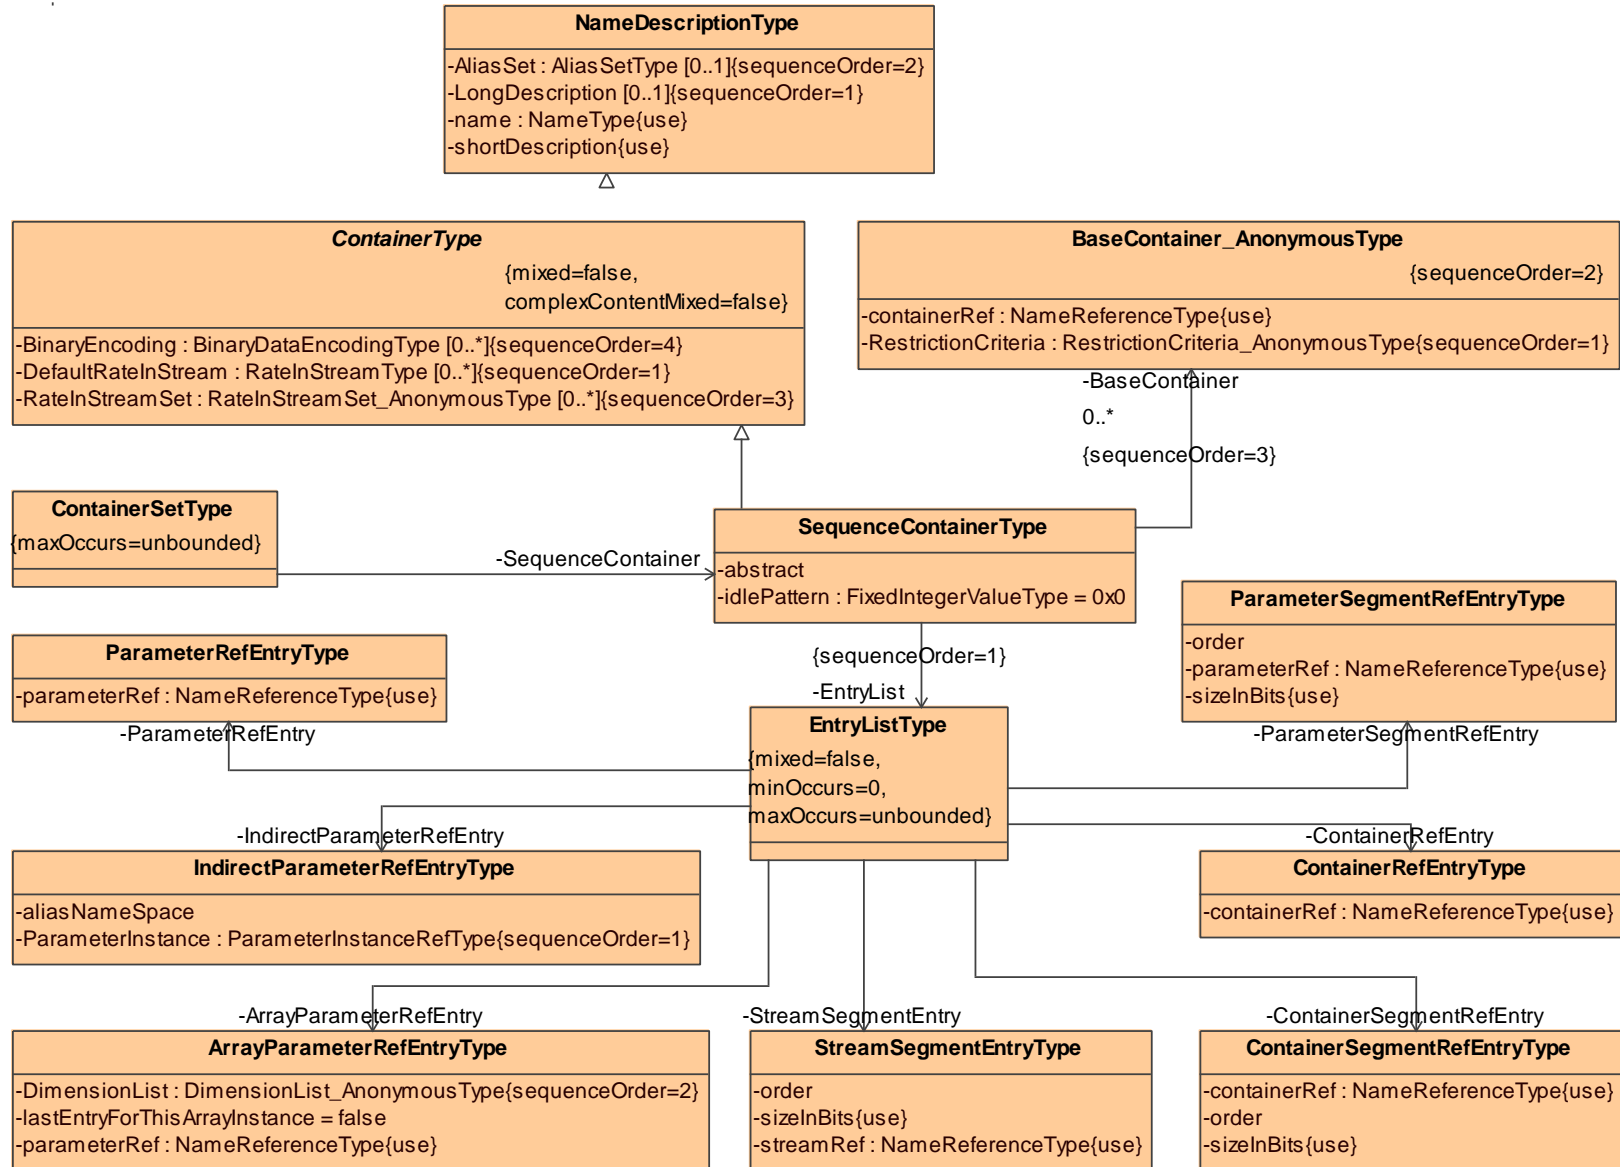

OBJECT MANAGEMENT GROUP

- On rare occasions Calibrations need to change as the SV enters different phases (factory test, on-orbit) or enters different operating modes (eclipse, LEO, safe-mode)
- On other occasions, it may be necessary to apply different Calibration curves depending on the uncalibrated value
- These phases, and operating modes are collectively called 'Contexts'
- ParameterTypes have an optional ContextCalibratorList
- The Calibrator from the first Context in the ContextCalibratorList to test true is applied.

Packaging - Container UML

OBJ

OM

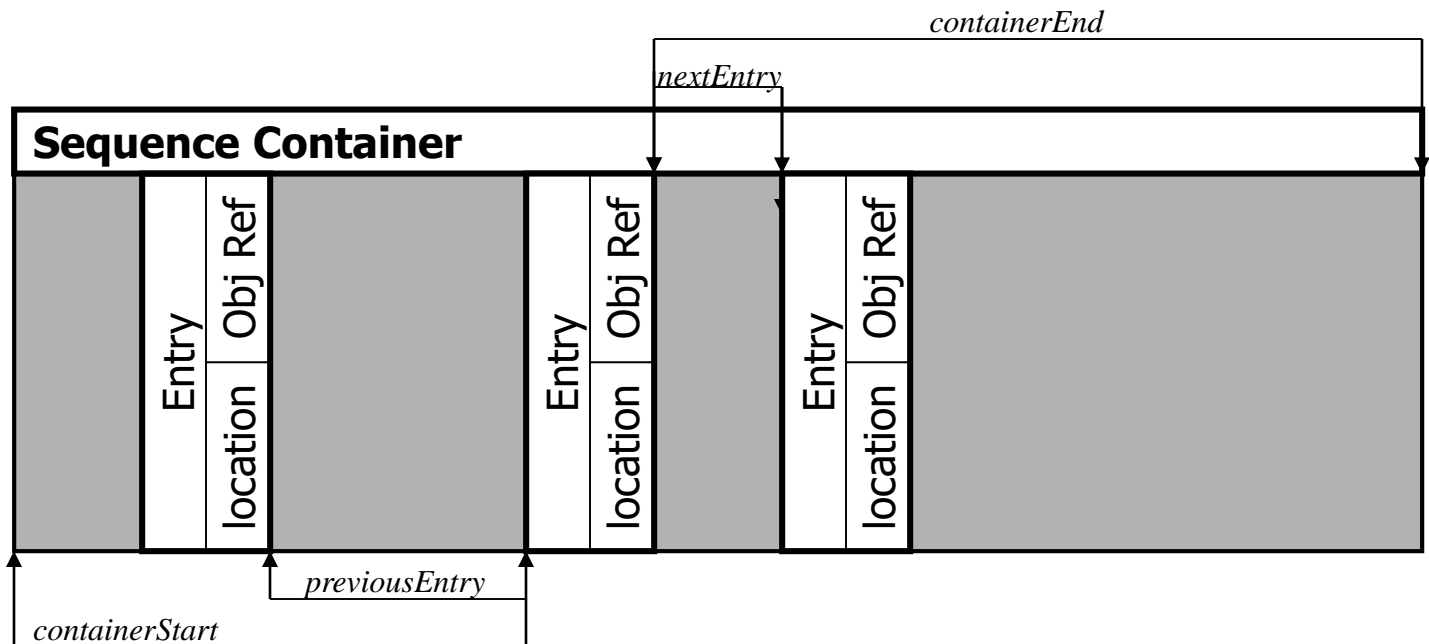

- because space applications need to interoperate better

Packaging – Entries

OBJECT MANAGEMENT GROUP

- Location of the entry is an integer value referenced from:
 - The end of the previous entry to the start of this entry (default)
 - The start of the container to the start of this entry
 - The end of the container to the end of this entry

Packaging – Array Entries

OBJECT MANAGEMENT GROUP

- An Array entry may refer to the entire array, a part of the array or a single element of the array.
- Entire Array: must supply the size of every dimension (e.g. $A[2][5][3]$). Array order is assumed to have a sequence where the 0th elements in the first (most significant) dimension is supplied first.
 - Thus, a three dimensional array whose size is $A[3][2][2]$ will have the sequence order as shown below

Packaging – Array Entries

OBJECT MANAGEMENT GROUP

- Partial Array: Where the entry is only part of the array (e.g. a row) and may simply be a single element of the array.
- Must supply the starting index and ending index for each dimension to be included in the entry.

Array $A_{i,j}$

$A_{0,0}$	$A_{0,1}$	$A_{0,2}$	$A_{0,3}$	$A_{0,4}$	$A_{0,5}$	$A_{0,6}$	$A_{0,7}$	$A_{0,j}$
$A_{1,0}$	$A_{1,1}$	$A_{1,2}$	$A_{1,3}$	$A_{1,4}$	$A_{1,5}$	$A_{1,6}$	$A_{1,7}$	$A_{1,j}$
$A_{2,0}$	$A_{2,1}$	$A_{2,2}$	$A_{2,3}$	$A_{2,4}$	$A_{2,5}$	$A_{2,6}$	$A_{2,7}$	$A_{2,j}$
$A_{3,0}$	$A_{3,1}$	$A_{3,2}$	$A_{3,3}$	$A_{3,4}$	$A_{3,5}$	$A_{3,6}$	$A_{3,7}$	$A_{3,j}$
$A_{i,0}$	$A_{i,1}$	$A_{i,2}$	$A_{i,3}$	$A_{i,4}$	$A_{i,5}$	$A_{i,6}$	$A_{i,7}$	$A_{i,j}$

Entry, size of least significant (last) dimension is 7. starting index for the last dimension is 2 and the ending index for the first dimension is 5. The starting index for the most significant (first) dimension is 1 and the ending index is 1.

OBJECT MANAGEMENT GROUP

Packaging - Entry Complexities

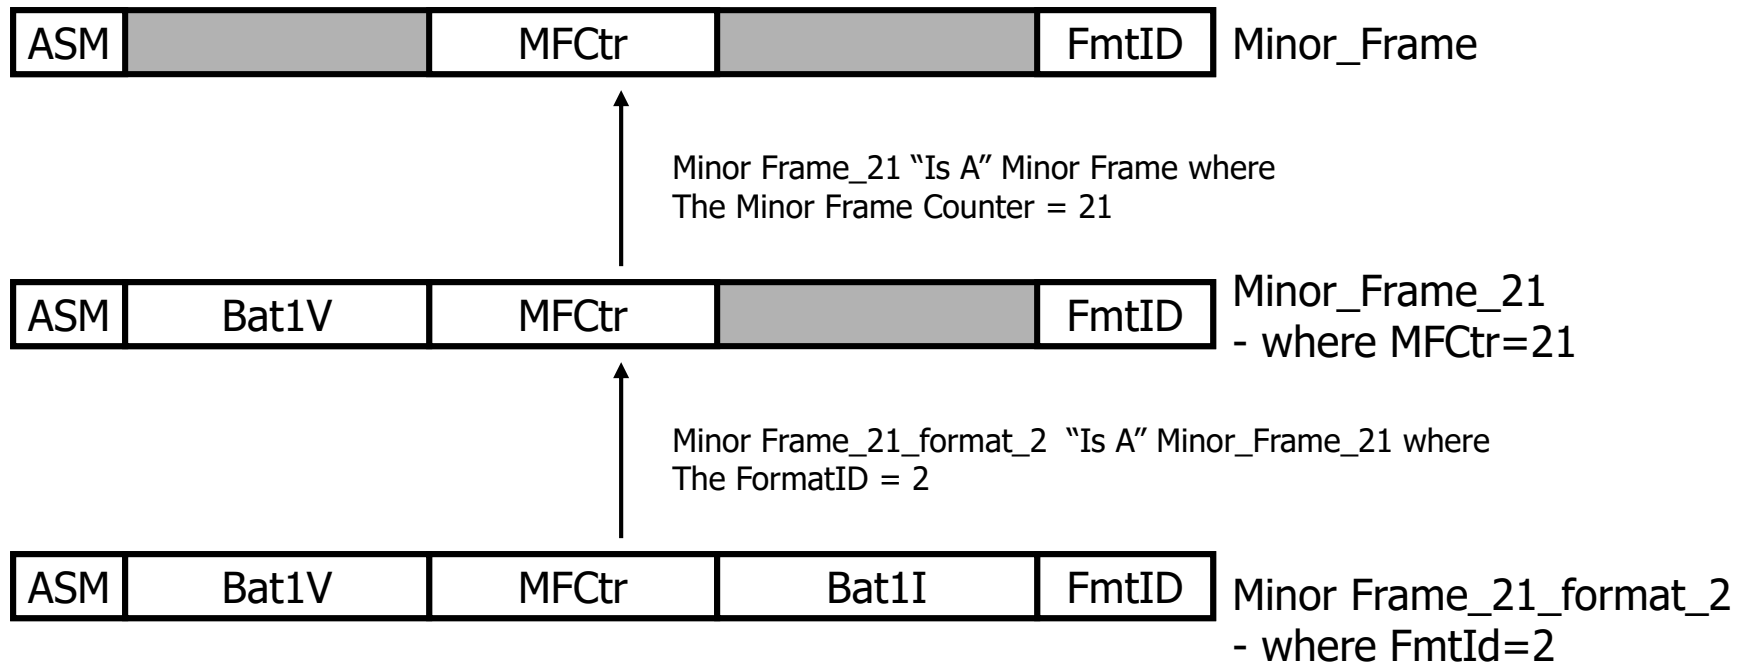

rarely used

- Location may be provided dynamically, from the value of a Parameter Instance (e.g., the start of a packet from in a CCSDS transfer frame).
- May have an “include” condition – A condition where the entry will not be included in the sequence.
- May include repeating contents where the count is given as a Parameter Instance value.

Packaging – Sequence Container Inheritance Example

OBJECT MANAGEMENT GROUP

Packaging - Inheritance

OBJECT MANAGEMENT GROUP

- The EntryList of the Base container is inherited by the child container and the Child's EntryList is concatenated to that of the Base.
- Doubly defined space is OK, multiple overlapping parameters are assumed.

Packaging - RestrictionCriteria

OBJECT MANAGEMENT GROUP

- Usually a single Parameter that must be equal to some number – a Comparison
- But, the comparison does not have to be ==
- Or, may be a comparison list (logically anded)
- Or, could be a BooleanEquation
- Or, could have a temporal relationship (container B comes after container A)
- Or, could be a reference to an external algorithm

<X>Refs

OBJECT MANAGEMENT GROUP

- ParameterRef, StreamRef, ContainerRef, etc.
- Uses Unix 'like' naming across the SpaceSystem Tree
e.g. /SimpleSat/Bus/EPDS/BatteryOne/Voltage
- The use of an unqualified name will search for a item in the current SpaceSystem first, then if none is found, in progressively higher space systems
e.g. a parameter reference "VCC" within a Container in the /SimpleSat/Bus sub-system will result first in a search of the Bus sub-system for "VCC" then in /SimpleSat.
- For arrays, use the zero based bracket notation
e.g. Voltage[3][6];

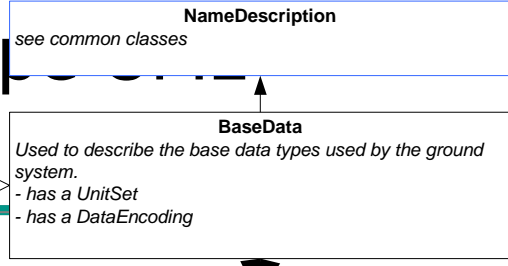

ParameterInstanceRefs

OBJECT MANAGEMENT GROUP

- Used when it's necessary to refer to a specific instance of a Parameter.
- Used when the value of the Parameter is used for a calculation or a reference
- The reference is either positive for forward or negative for backward in time, 0 is the current value or the very first instance of the Parameter within a container of concern.

Data Type

Parameters have Alarms
validRange and alarms go with data type

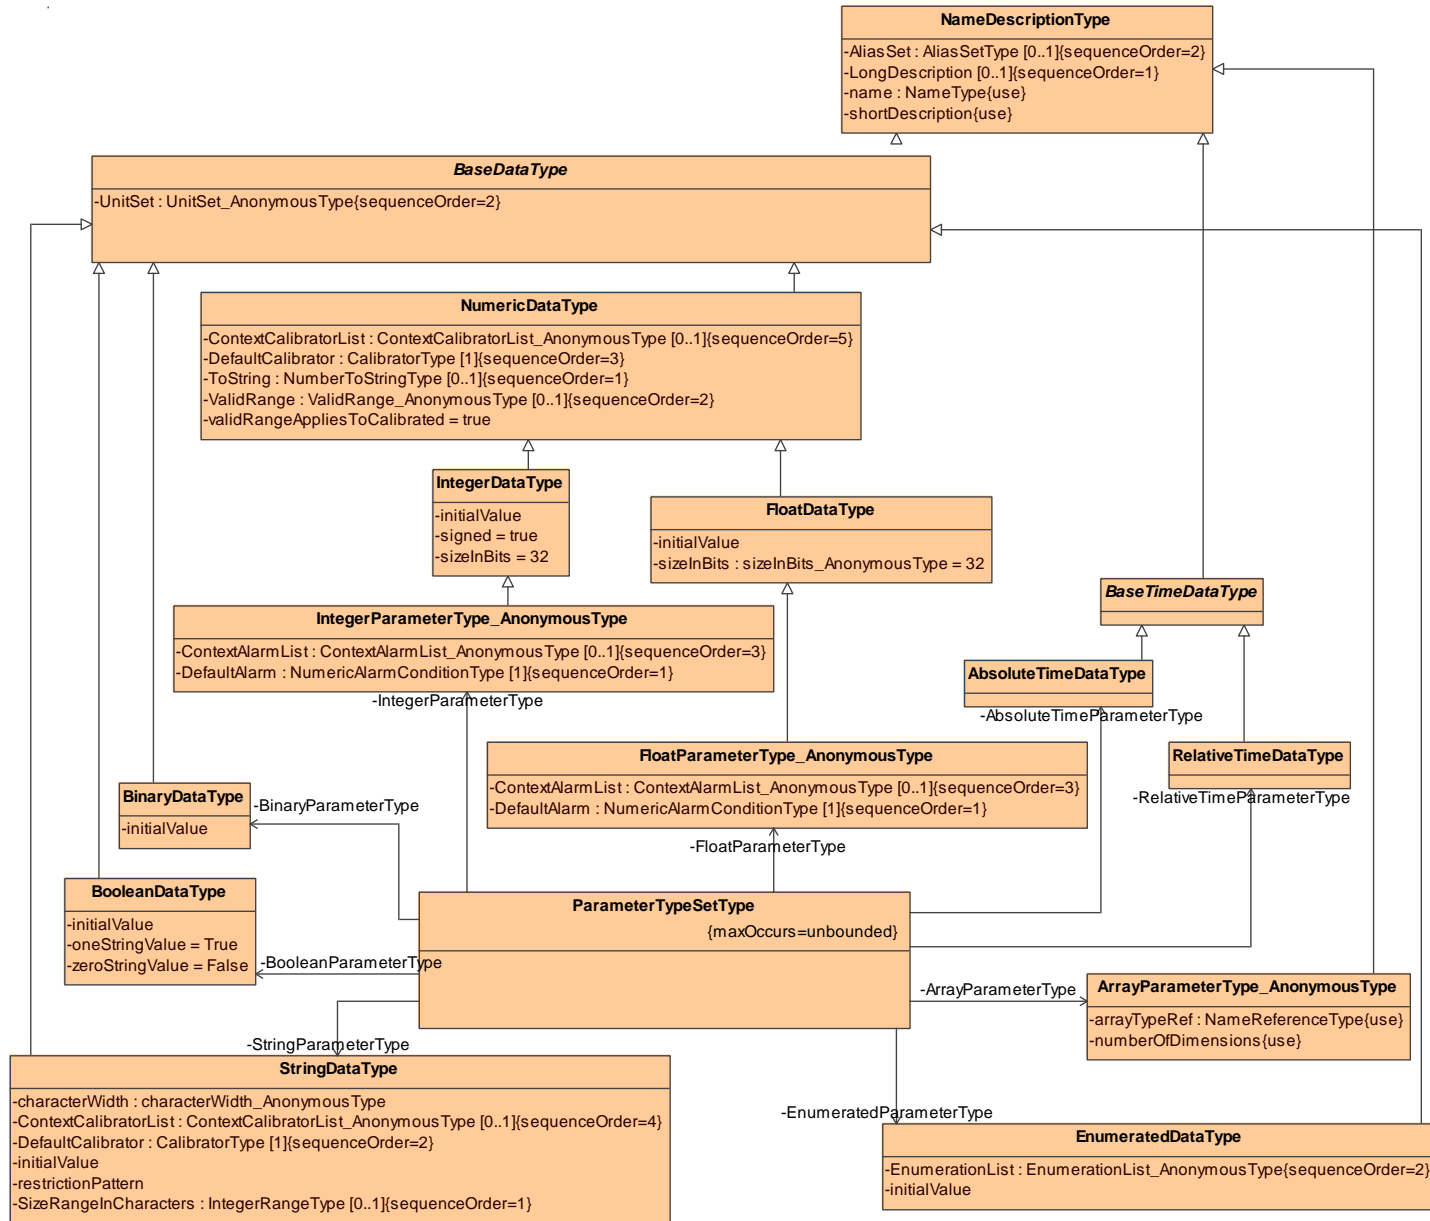

Arguments are a simple extension of the <X>DataTypes

Parameter Type UML

OBJECT MANA

Data Types

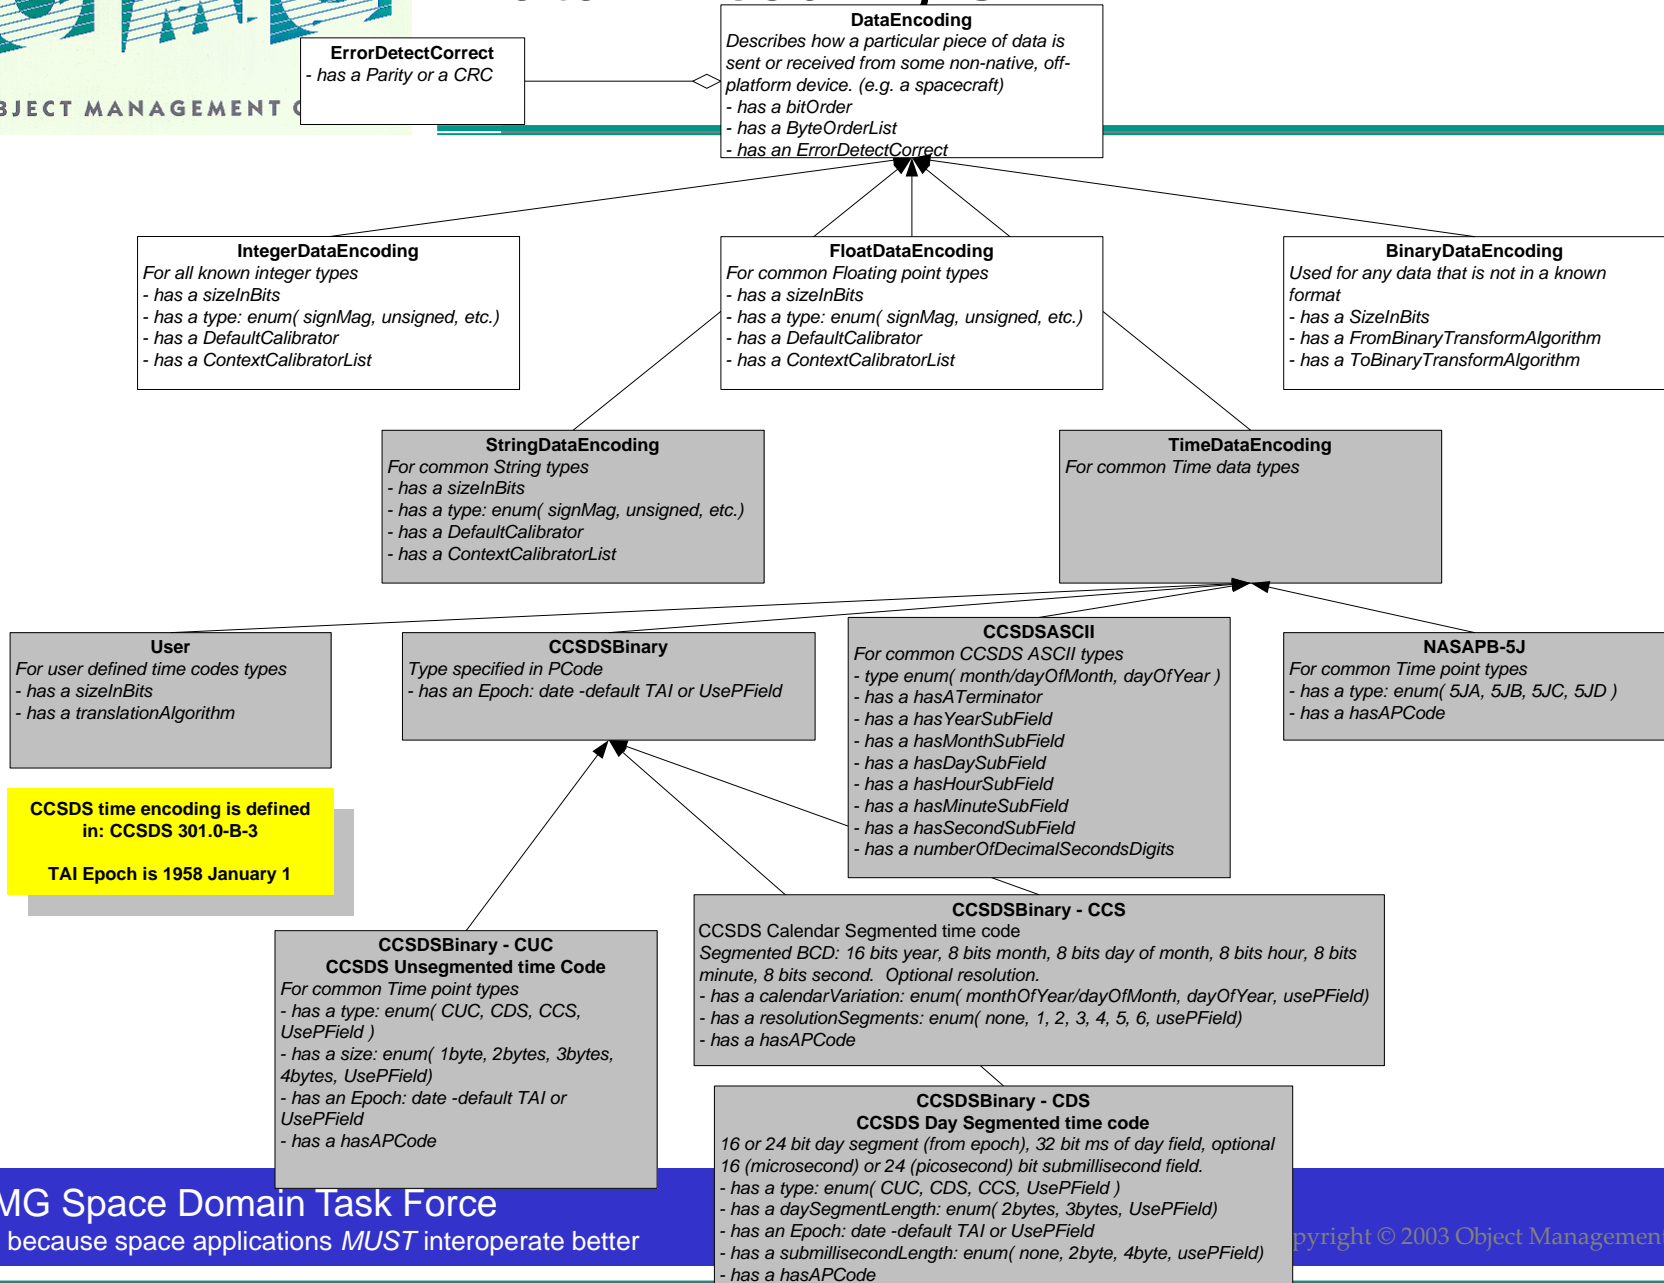

OBJECT MANAGEMENT GROUP

- Parameters and Command Arguments are sub-types of Data
- All data types may have an initial value

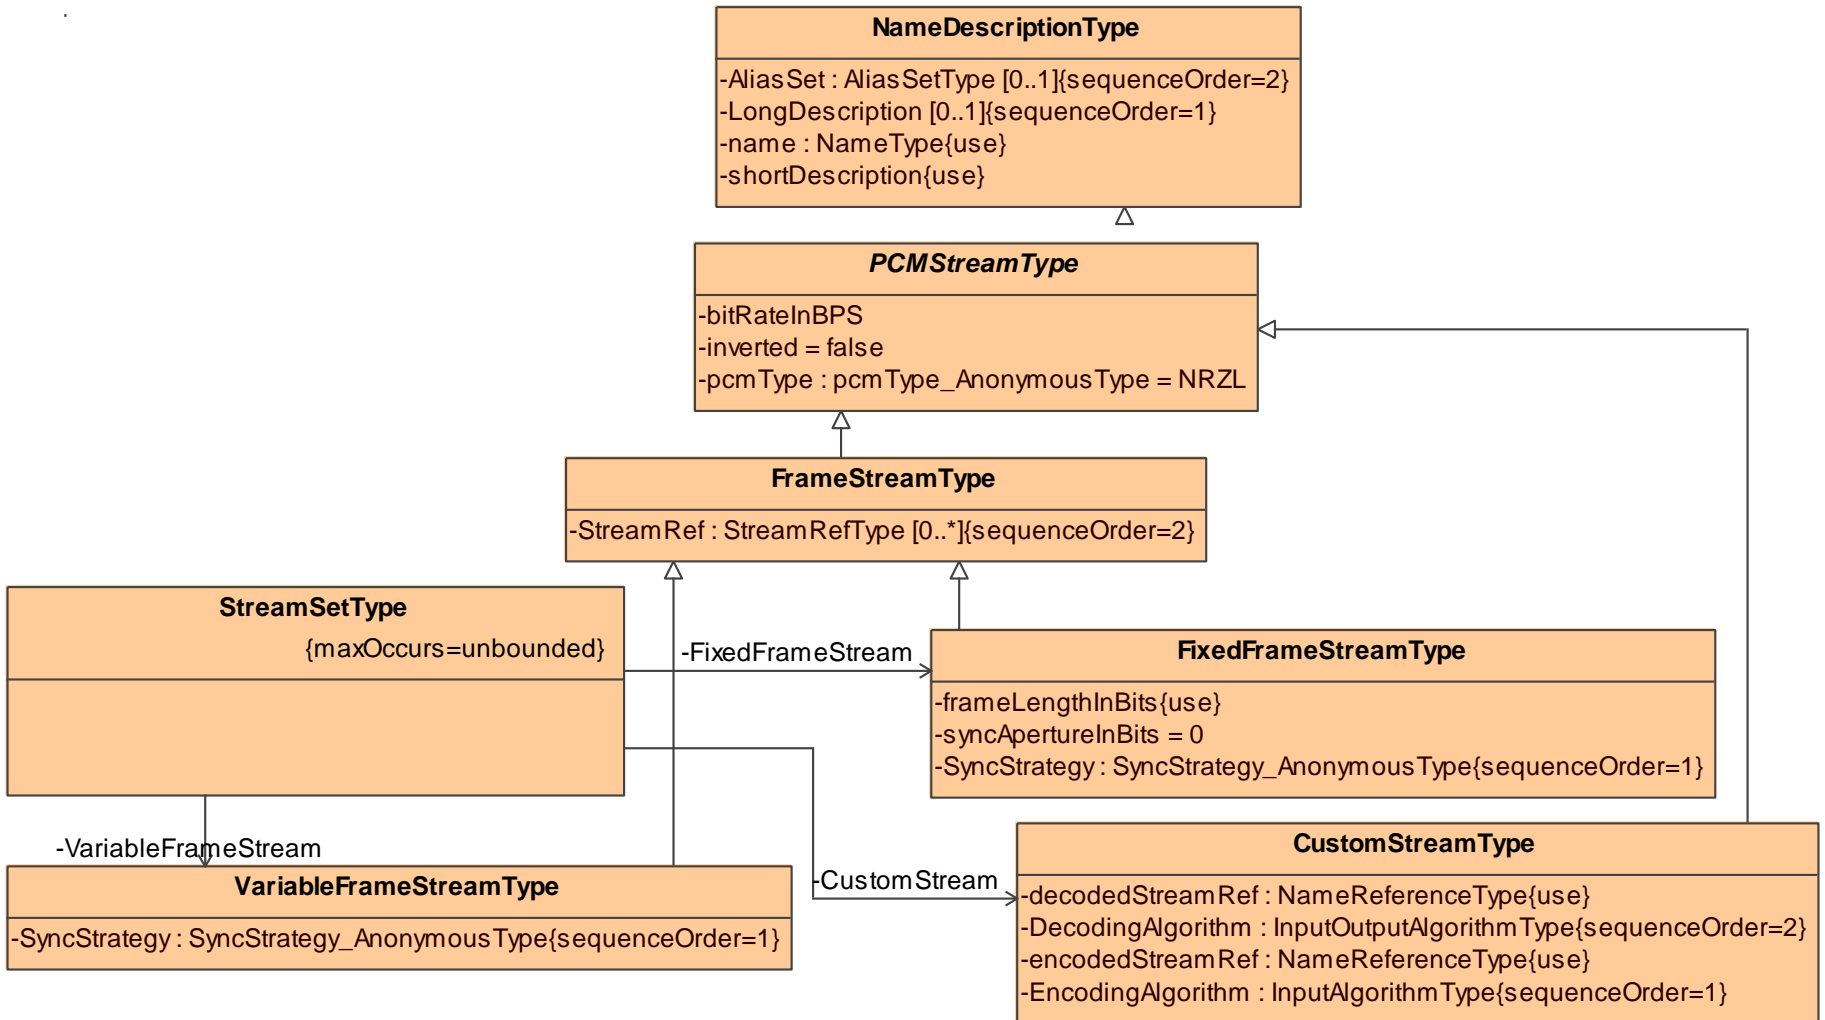

Data Encoding UML

OBJECT MANAGEMENT GROUP

Stream UML

Algorithms

OBJECT MANAGEMENT GROUP

- XTCE does not have its own algorithm languages, but the database format must still refer to external algorithms from time to time
- The basic algorithm type simply refers to some external algorithm
 - External algorithm may be a script, a shared library name, a Java Object file, etc.
 - Multiple references may be included so that a single XTCE file may be used across multiple ground systems.

Algorithm Inputs and Outputs

OBJECT MANAGEMENT GROUP

- Some Algorithms allow a set of inputs
 - Inputs are named ParameterInstanceRefs or
 - Named Constants
- Some Algorithms also allow a set of outputs
 - Outputs are named ParametersRefs

Algorithm Triggers

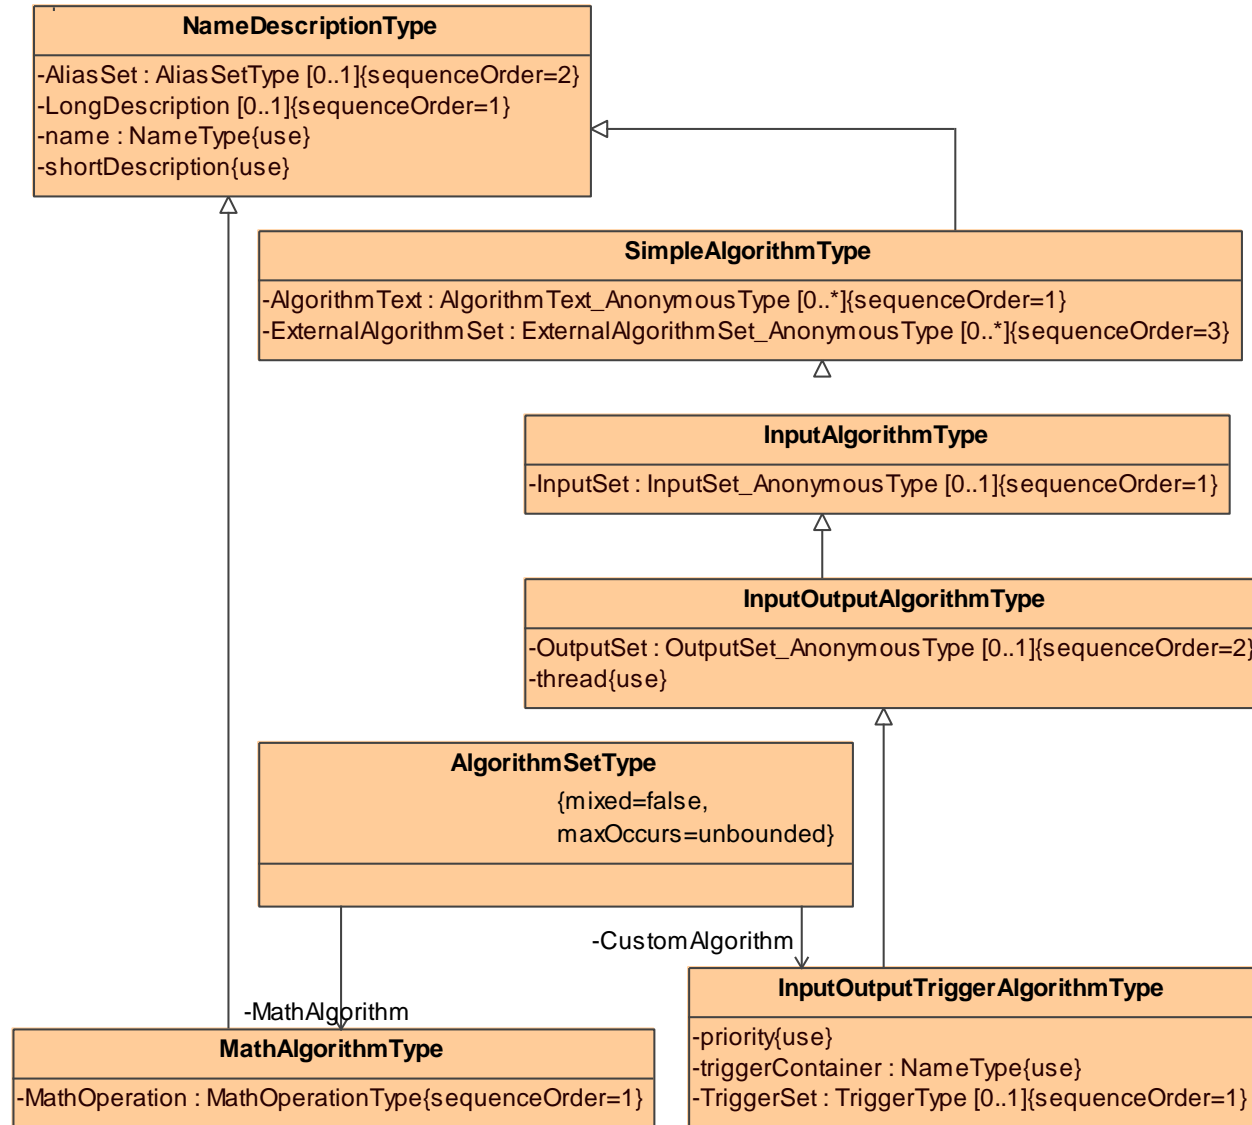

OBJECT MANAGEMENT GROUP

- Triggers are used to initiate the processing of some algorithms. A trigger may be based on an update of a Parameter or on a time (periodic) basis.
- Triggers may also have a rate that limits their firing to a $1/\text{rate}$ basis.

Algorithm UML

OBJECT MANAGEMENT

Alarms – Simple to Complex

OBJECT MANAGEMENT GROUP

- Simple (Default Limits):
 - warning, critical

```
<DefaultAlarm>
```

```
<StaticAlarmRanges>
```

```
<WarningRange minInclusive="-22" maxExclusive="12"/>
```

```
<CriticalRange minExclusive="-40" maxInclusive="13.7"/>
```

```
</StaticAlarmRanges>
```

```
</DefaultAlarm>
```

Alarms – A Little More Complex

OBJECT MANAGEMENT GROUP

- Actually 6 ranges are available in increasing severity:
 - normal -> watch -> warning -> distress -> critical -> severe
- All of the ranges are optional
- The normal range is implied to be inside the least severest range

Alarms – ChangePerSecond

OBJECT MANAGEMENT GROUP

- Parameters have an optional ChangePerSecond (Dynamic/rate-of-change) set of alarm ranges
- Both have static limits and rate-of-change limits

```
<DefaultAlarm>
```

```
<ChangePerSecondAlarmRanges>
```

```
<WarningRange minInclusive="5" maxExclusive="5"/>
```

```
<SevereRange minExclusive="-8" maxInclusive="8"/>
```

```
</ChangePerSecondAlarmRanges>
```

```
</DefaultAlarm
```

OBJECT MANAGEMENT GROUP

Alarms - ContextAlarms

- Oftentimes Alarm ranges need to change as the SV enters different phases (factory test, on-orbit) or enters different operating modes (eclipse, LEO, safe-mode).
- These are all collectively called 'Contexts'
- Parameters have an optional ContextAlarmList
- Alarms from the first Context in the ContextAlarmList to test true are applied.

OBJECT MANAGEMENT GROUP

Alarms – Context Alarm Example

```
<ContextAlarmList>
```

```
  <ContextAlarm>
```

```
    <StaticAlarmRanges>
```

```
      <WarningRange minInclusive="-22.2" maxExclusive="12.2"/>
```

```
      <CriticalRange minExclusive="-44" maxInclusive="14"/>
```

```
    </StaticAlarmRanges>
```

```
    <ContextMatch>
```

```
      <ComparisonList>
```

```
        <Comparison parameterRef="/sc-operating-environment" value="LEO"/>
```

```
      </ComparisonList>
```

```
    </ContextMatch>
```

```
  </ContextAlarm>
```

```
</ContextAlarmList>
```

OBJECT MANAGEMENT GROUP

Alarms – Conditional Alarm

- Used when the Alarm is more than a simple range
- Alarm is set when a Condition is true
- There is a Condition (MatchCriteria) for each Alarm level
- Highest Level to test true will be the Alarm Condition

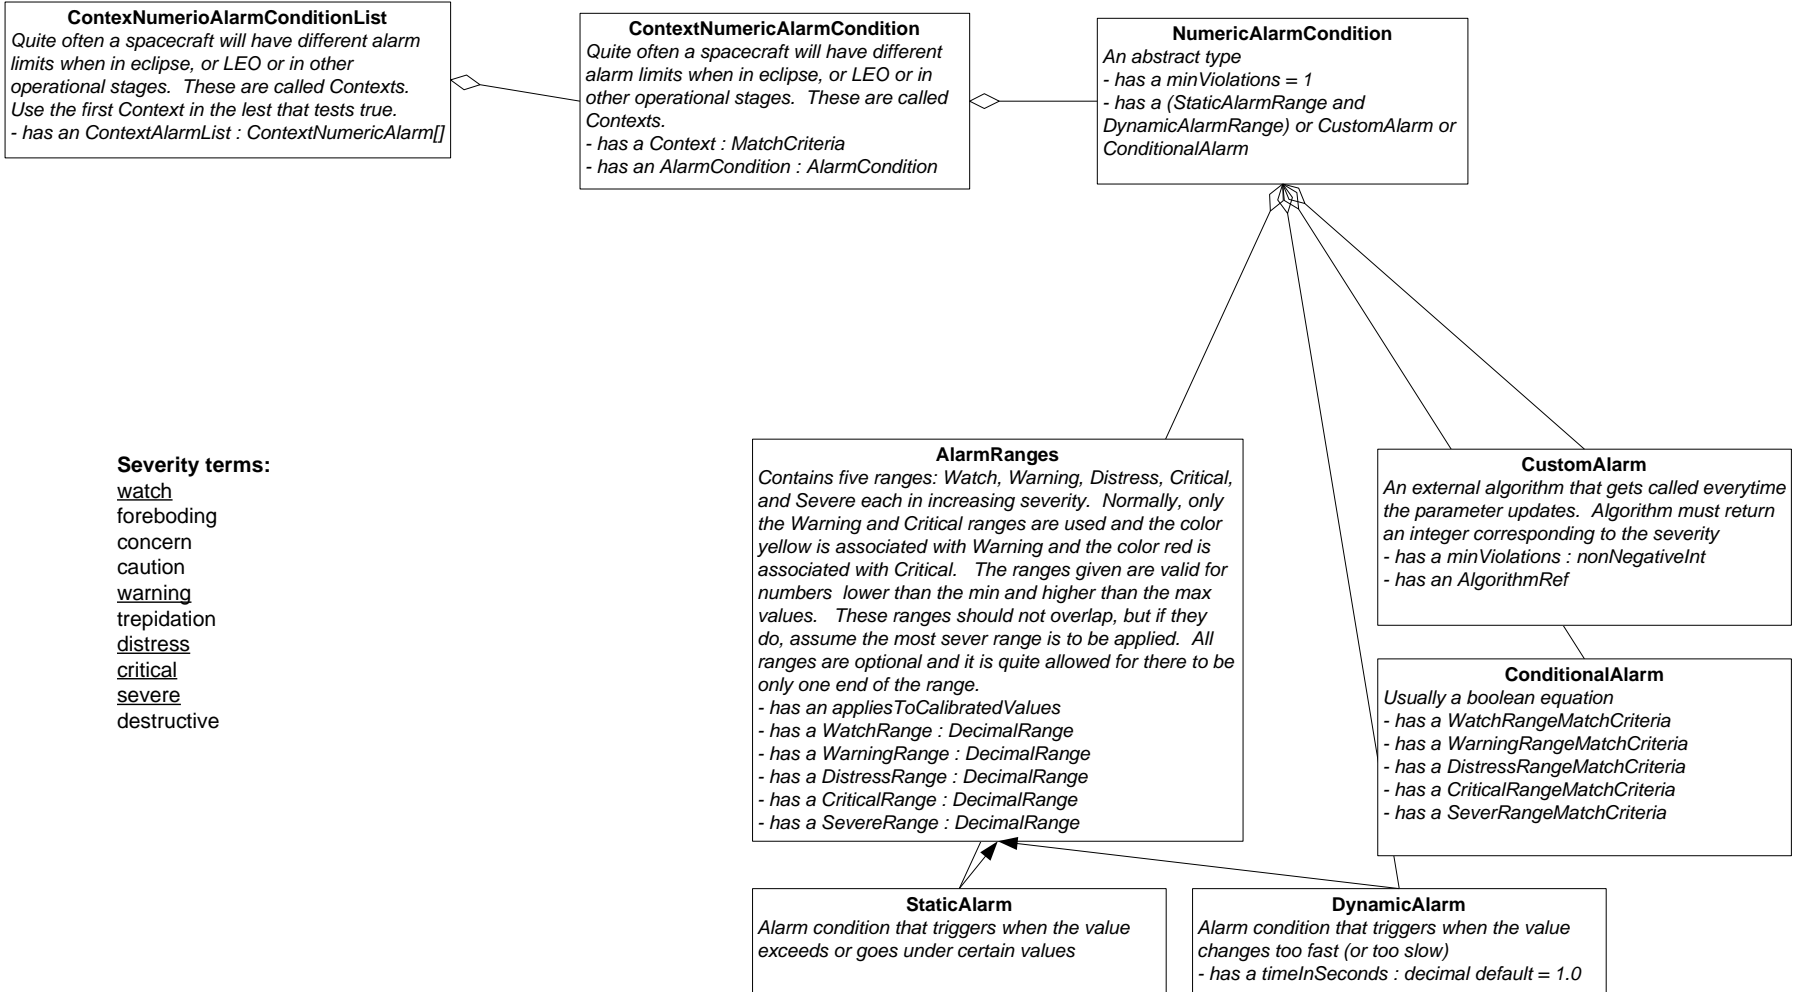

Alarms – User Algorithm

- Used when the conditions for the Alarm are too complex to otherwise describe in XTCE
- A reference to an external algorithm that will set the Alarm state

Alarms - Numeric Alarm UML

OBJECT MANAGEMENT GROUP

Severity terms:

- watch
- foreboding
- concern
- caution
- warning
- trepidation
- distress
- critical
- severe
- destructive

OBJECT MANAGEMENT GROUP

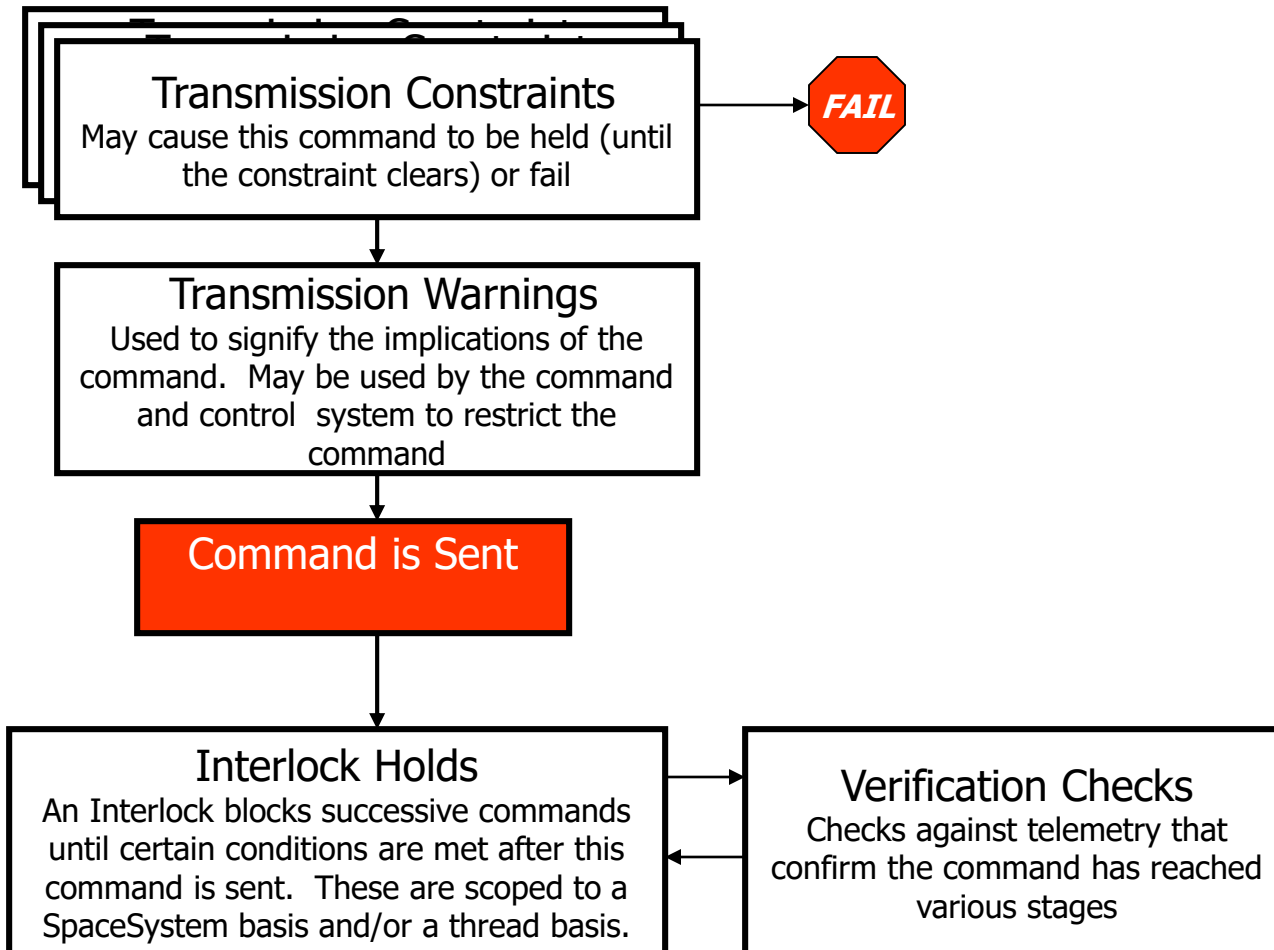

Command Processing Flow

- Similar to Telemetry processing flow

Command Execution Sequence

OBJECT MANAGEMENT GROUP

Command Verification Stages

Failed

Command Restrictions

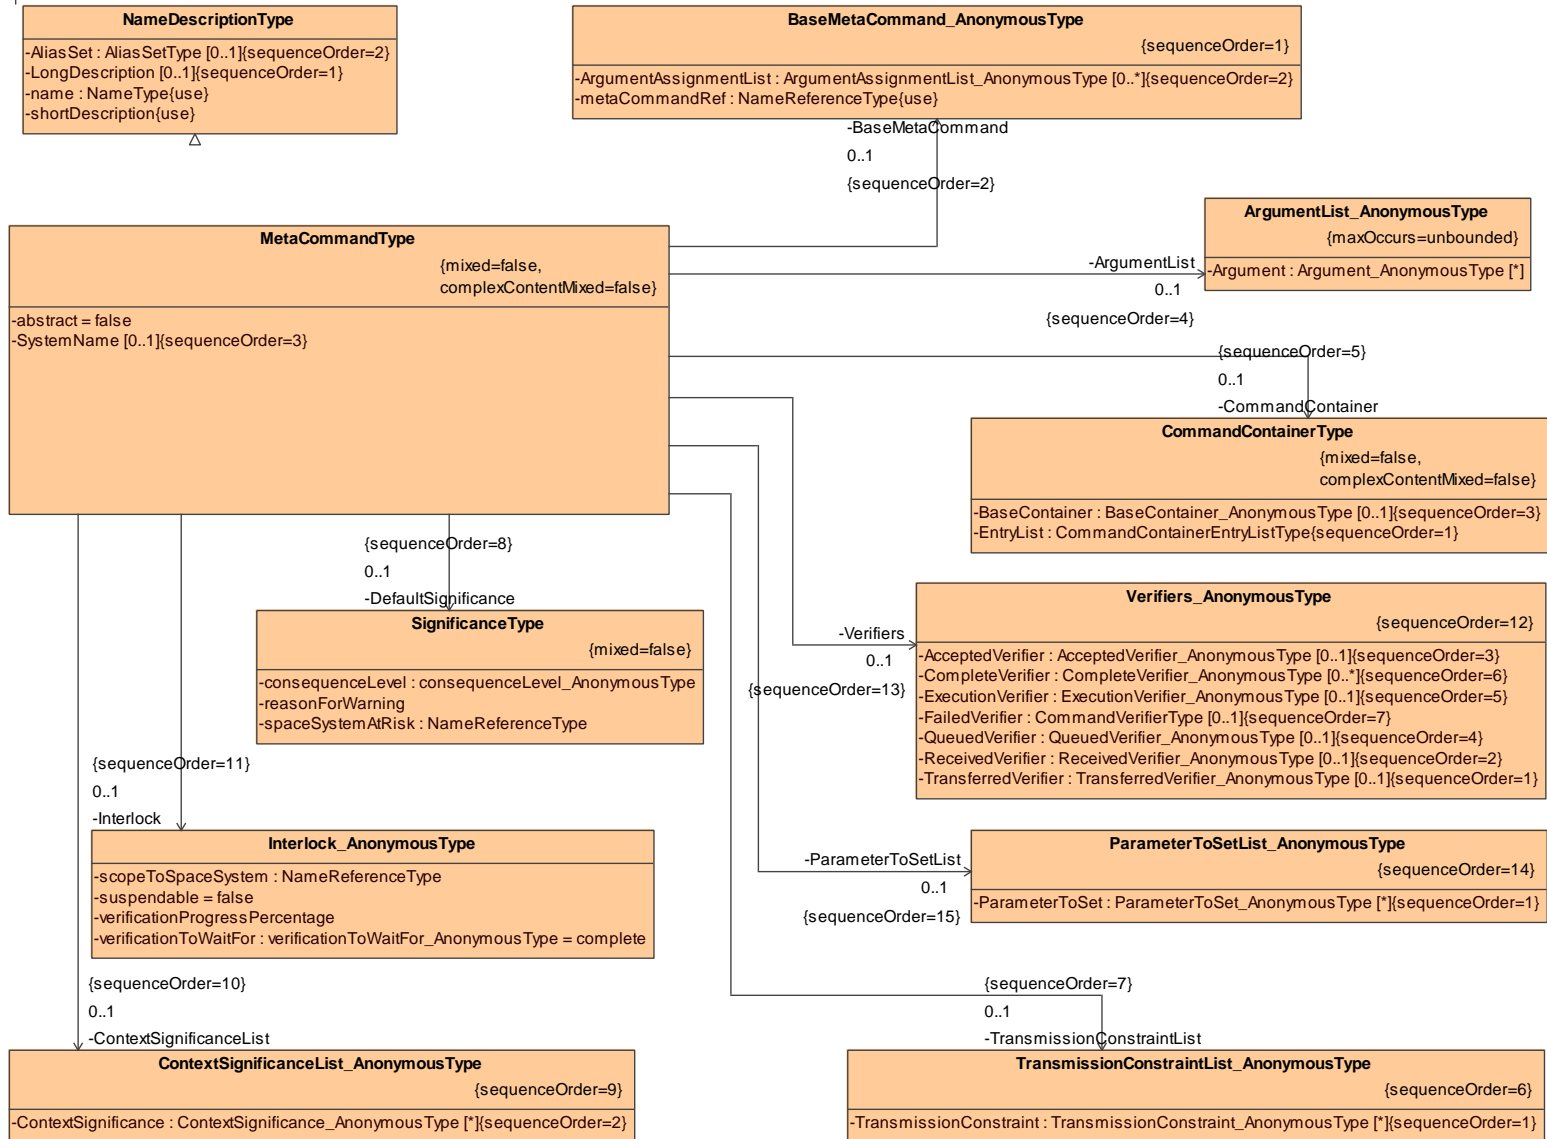

OBJECT MANAGEMENT GROUP

- Prohibited - Command should not be sent
- spaceSystemRisk – A warning that the issuance of this command may incur risk to the space system
- missionRisk – A warning that the issuance of this command may disrupt service
- Caution – A general warning

Command Meta Data UML

OBJECT

Nuances - Descriptions

OBJECT MANAGEMENT GROUP

- shortDescription – all major elements have this attribute for short “tool tip” size descriptions (max size of 32 characters)
- LongDescription – all major elements also have this as a sub-element; it is intended for “instructive” type descriptions. HTML markup is allowed in LongDescriptions.
Neither shortDescription nor LongDescription have size limitations.

Nuances – Aliases

OBJECT MANAGEMENT GROUP

- Aliases –all major Elements may have an unlimited number of aliases. Aliases may be used for ground IDs, Onboard IDs, mnemonics etc.
- An alias has a nameSpace e.g., *OnBoardID* and the alias e.g. *020660*

```
<AliasSet>
```

```
<Alias nameSpace="Mnemonic" alias="BAT1I"/>
```

```
<Alias nameSpace="OnBoardID" alias="020660"/>
```

```
</AliasSet>
```

Nuances – Integer Values

OBJECT MANAGEMENT GROUP

- May be specified as a decimal number: e.g., 1234
- May be specified as a hexadecimal number: e.g., 0xFA or 0Xfa
- May be specified as an octal number: e.g., 0o123 or 0O123
- May be specified as a binary number: e.g., 0b0110 or 0B0110
- If the size is smaller than the number given, the number is truncated from the most significant side

OBJECT MANAGEMENT GROUP

Nuances – Physical Address

- Physical Address's are most often used by the Spacecraft factory
- Contains a sourceName, a sourceAddress, and a SubAddress (arbitrarily deep)
- There may be any number of Physical Address's

```
<PhysicalAddressSet>
```

```
  <PhysicalAddress sourceName="TransducerIP" sourceAddress="143.57.15.01">
```

```
    <SubAddress sourceAddress="TransducerCard" sourceName="8">
```

```
      <SubAddress sourceName="portNumber" sourceAddress="14"/>
```

```
    </SubAddress>
```

```
  </PhysicalAddress>
```

```
</PhysicalAddressSet>
```

Nuances - Units

OBJECT MANAGEMENT GROUP

- Units in XTCE were a compromise between the very complex and overly simple.
- All Data Types (Parameters and Command Arguments) have a mandatory UnitSet – the UnitSet may be empty.
- Unit has a factor and a power. Multiple Units are multiplied.

```
<FloatParameter name="DarkEnergySensor">
```

```
  <UnitSet>
```

```
    <Unit>Joules</Unit>
```

```
    <Unit power="-4">m</Unit>
```

```
  </UnitSet>
```

```
  <IntegerDataEncoding sizeInBits="7" encoding="unsigned"/>
```

```
</FloatParameter>
```

$$= \frac{\text{Joules}}{m^4}$$

Schema Style Notes Used By The SDTF

OBJECT MANAGEMENT GROUP

- Element and Type names begin with a capitol letter.
- Type names end with the word "Type".
- Attribute names begin with a lowercase letter.
- Usually, when the UML class diagram references classes, W3C Elements are used, and whenever the UML references simple types (strings, ints), W3C Attributes are used. In general, attributes are preferred over elements because they're easier to deal with in SAX and DOM, but whenever the Element/Attribute may one day carry metadata, elements should be used. One exception, is enumerated classes, because enumerations may be defined for attributes but not for elements.
- Bias toward self-describing names over short, bandwidth conserving ones.
- Use mixed case in names rather than underscores to combine multiple words (camelCase).

Schema Style Notes (cont)

OBJECT MANAGEMENT GROUP

- A documentation annotation is included in every element and type definition. Annotations for a type are included with the type definition, use of the type are annotated in the element definition.
- Hints on units (for values with units) are provided in the names of attributes and elements (e.g. "dataRateInBPS" is preferred over "dataRate" OR "frameLengthInBits" is preferred over "frameLength").
- Major elements or any elements used multiple times are first defined with a complexType definition
- All collections are put inside either a "List" element or a "Set" Element depending on whether the collection is ordered or unordered.
- Simplicity in compliant XML files is favored over simplicity in the schema.

ServiceList

OBJECT MANAGEMENT GROUP

Similar in concept to “Unix” system services. For example TCP port 80 always has HTTP packets under Unix. So on your spacecraft, APID 1024 might always have memory dump telemetry packets. Separating that out as a “service” could help you organize your telemetry. (blame ESA/PUS for this... but seems like a good idea)

Services

OBJECT MANAGEMENT GROUP

- There is some debate on the necessity of this.
