# Purpose of this material

Summarize an approach to “packaging” a diverse set of MBSE examples being assembled by the INCOSE MBSE Transformation

# The challenge

- The model examples being collected are very diverse in their content, style, purpose, nomenclature, and other aspects—they differ in many dimensions simultaneously.
- This is because of their different origins, purposes, illustrated concepts, domains, uses and users, and other aspects
- That diversity is in part positive, by representing a range of possible approaches to various aspects of MBSE—it can be informative
- But, that diversity can also make it harder for the intended audience to organize their impressions of what they are seeing, to understand the intentions of the individual examples, to recognize that some differences are domain-based, or less significant, etc.
- We don't want to “homogenize” the examples.
- So, how do we “organize their diversity”?

# Proposed approach

- Package each example in a “wrapper” of Model Metadata which is sufficiently broad to uniformly characterize them in their diversity.
- Use the INCOSE/ASME Model Stakeholder Features Pattern as that metadata wrapper—a metadata “signature” of each model, configured for each model.

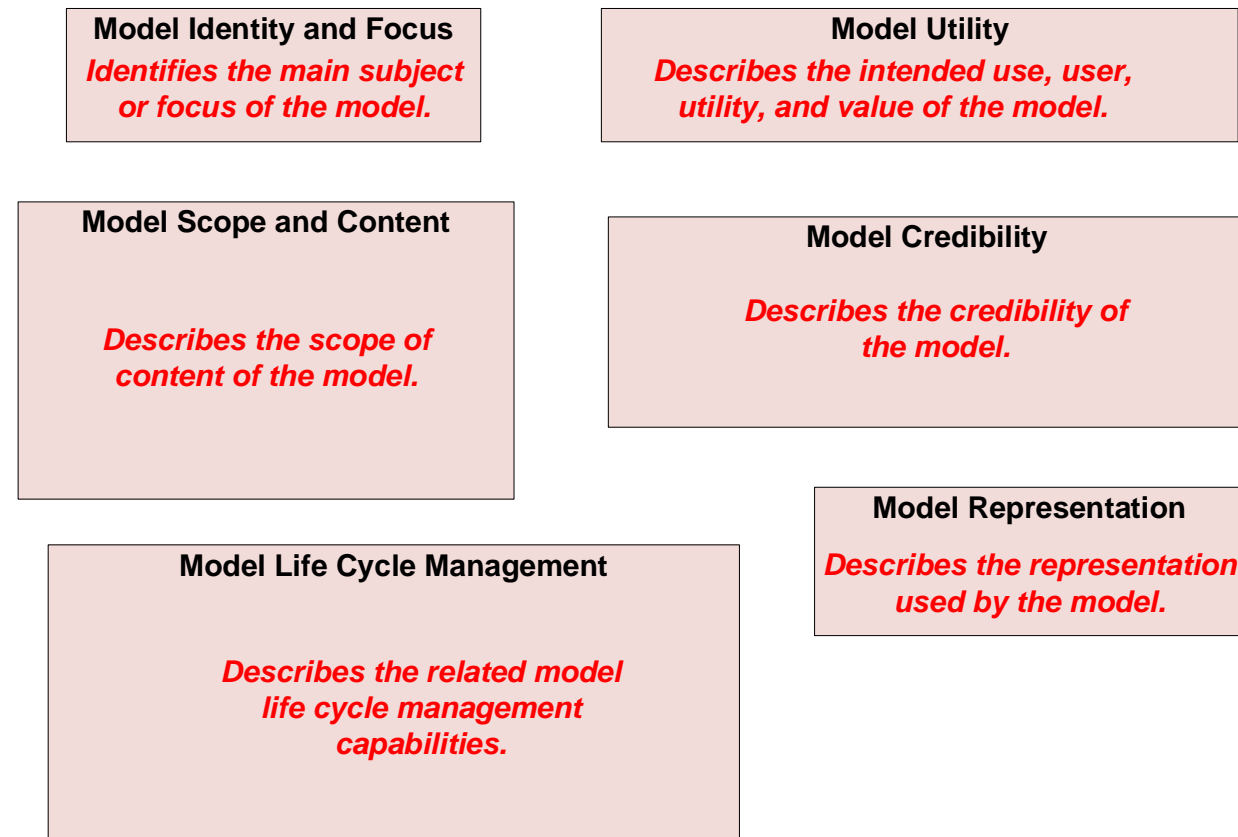

# Proposed approach

- Models exist for purposes (intended uses) and users
- Models themselves have stakeholders—those with an interest in the success of the model
- A summary description of a model can be given in language of generic Model Stakeholders, describing the model’s domain, intended use (purpose) and users , subject system, representation type, related media, and other aspects, without getting into all the technical details of the model itself.
- In fact, without that description, one can usually not even find out the answers to those important questions just by inspecting the model—just as a Martian could not discover the intended use of an automobile by examining one.
- So, “metadata” about a model is like the Universal Product Code stamped on a food package—it is description of what is inside.

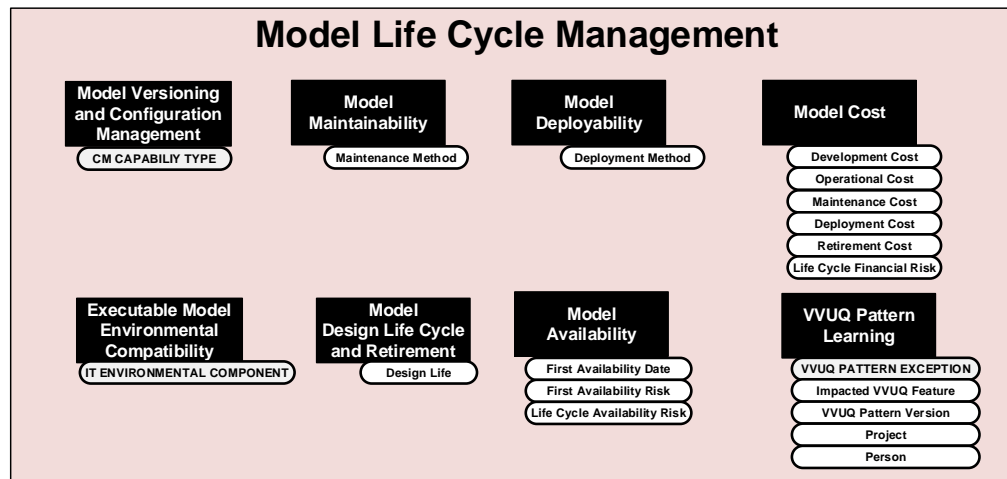

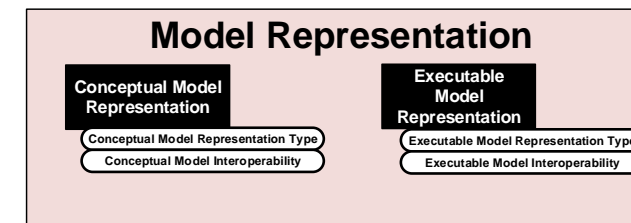

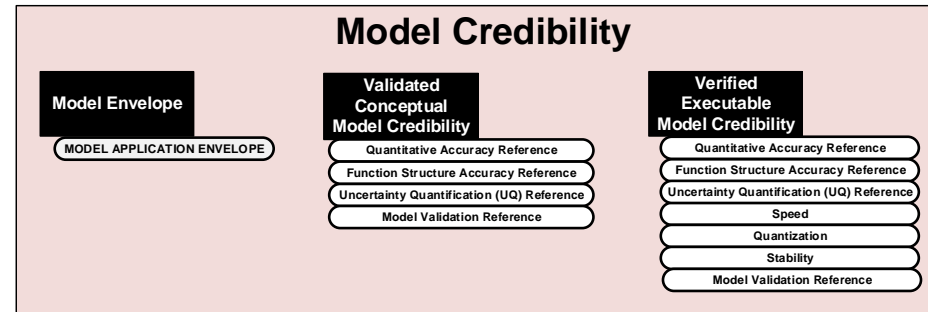

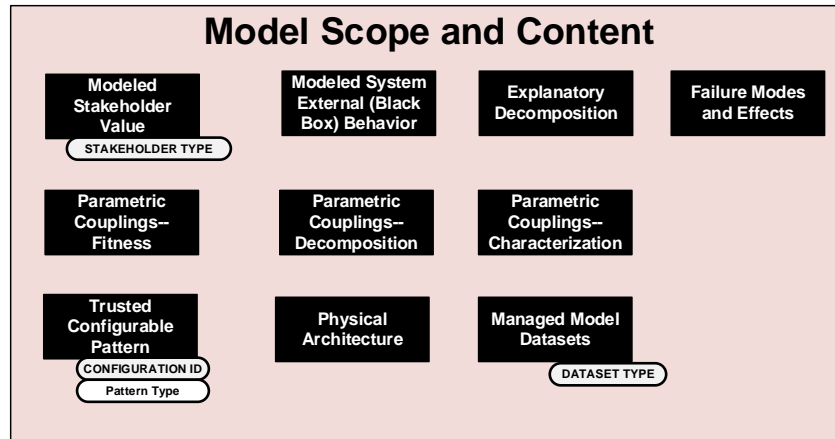

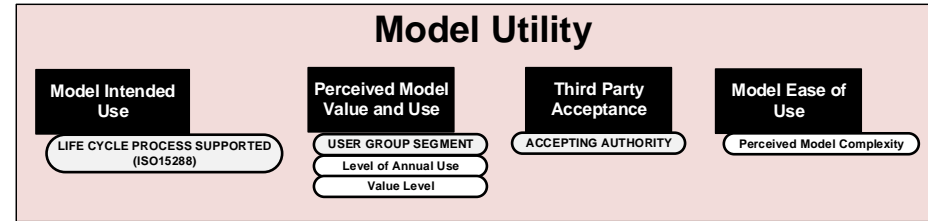

# INCOSE/ASME Model Stakeholder Features Pattern

- Being created in the INCOSE supported ASME VV50 standards committee project, also in use in the INCOSE MB Transformation Project Products:
  - Metadata, in the form of a model itself, instead of a bar code, describing “what is in the package” (the model being described by the metadata)
  - 29 Model Features, spread across 6 Feature Groups:

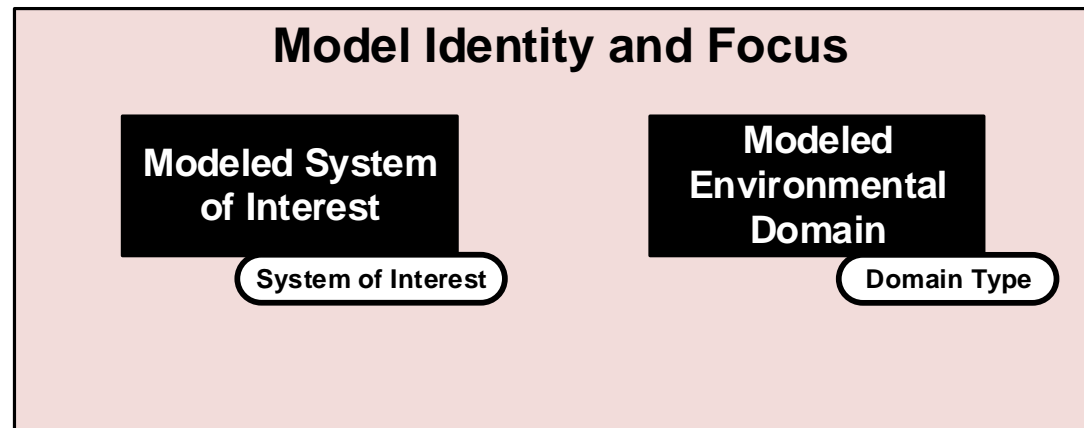

# INCOSE/ASME Model Stakeholder Features Pattern

Legend:

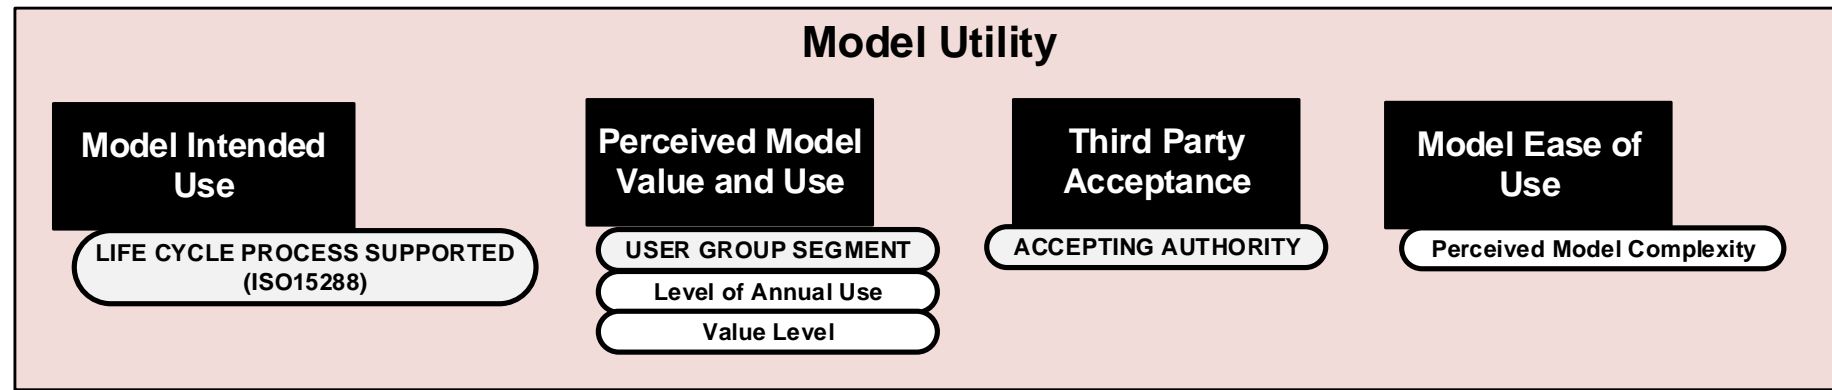

Feature Group	Feature Name	Feature Definition	Feature Attribute	Attribute Definition	Feature Stakeholder						Model Type		
					Model User	Model Developer	Model Maintainer	Mdl Deployer-Distributor	Model Use Supporter	Regulatory Authority	Mdl Investor-Owner	Physics Based	Data Driven
<b>Identifies the main subject or focus of the model</b>													
Model Identity and Focus	Modeled System of Interest	Identifies the type of system this model describes.	System of Interest	Name of system of interest, or class of systems of interest	X					X	X	X	X
	Modeled Environmental Domain	Identifies the type of external environmental domain(s) that this model includes.	Domain Type(s)	Name(s) of modeled domains (manufacturing, distribution, use, etc.)	X					X	X	X	X

## Model Utility

Feature Group	Feature Name	Feature Definition	Feature Attribute	Attribute Definition	Feature Stakeholder							Model Type	
					Model User	Model Developer	Model Maintainer	Mdl Deployer-Distributor	Model Use Supporter	Regulatory Authority	Mdl Investor-Owner	Physics Based	Data Driven
<b>Describes the intended use, utility, and value of the model</b>													
Model Utility	Model Intended Use	The intended purpose(s) or use(s) of the model.	Life Cycle Process Supported	The intended life cycle management process to be supported by the model, from the ISO 15288 process list. More than one value may be listed.	X					X	X	X	X
	Perceived Model Value and Use	The relative level of value ascribed to the model, by those who use it for its stated purpose.	User Group Segment	The identify of using group segment (multiple)	X					X	X	X	X
			Level of Annual Use	The relative level of annual use by the segment	X					X	X	X	X
			Value Level	The value class associated with the model by that segment	X					X	X	X	X
	Third Party Acceptance	The degree to which the model is accepted as authoritative, by third party regulators, customers, supply chains, and other entities, for its stated purpose.	Accepting Authority	The identity (may be multiple) of regulators, agencies, customers, supply chains, accepting the model	X					X	X	X	X
Model Ease of Use	The perceived ease with which the model can be used, as experienced by its intended users	Perceived Model Complexity	High, Medium Low	X					X		X	X	

# Model Scope and Content

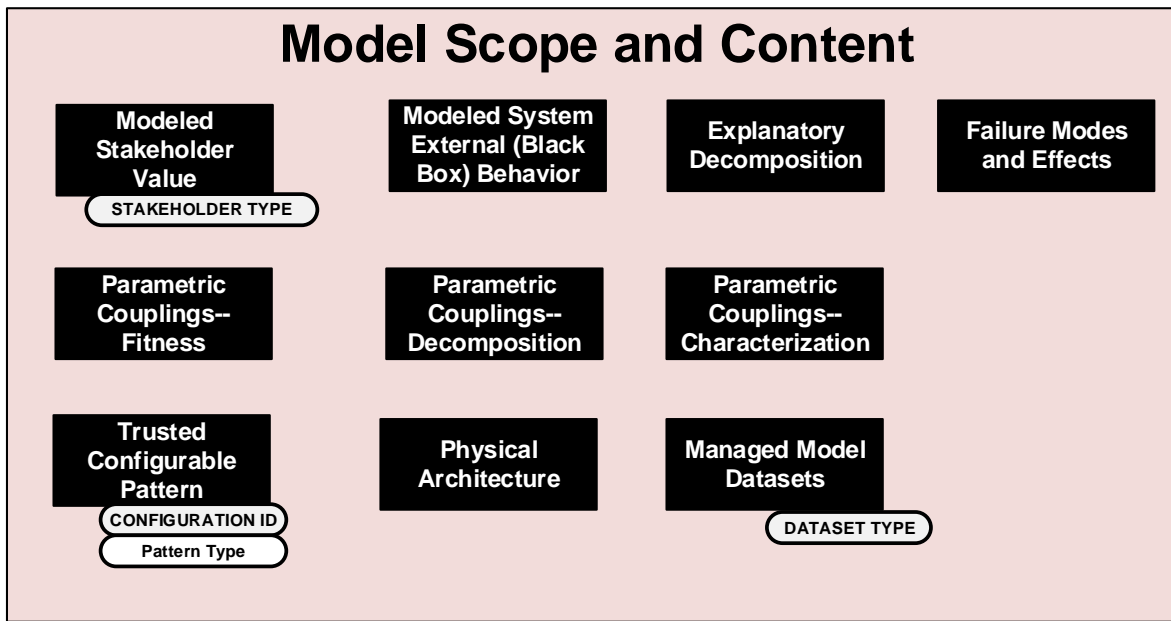

Feature Group	Feature Name	Feature Definition	Feature Attribute	Attribute Definition	Feature Stakeholder							Model Type		
					Model User	Model Developer	Model Maintainer	Mdl Deployer-Distributor	Model Use Supporter	Regulatory Authority	Mdl Investor-Owner	Physics Based	Data Driven	
<b>Describes the scope of content of the model</b>														
Model Scope of Content	Modeled Stakeholder Value	The capability of the model to describe fitness or value of the System of Interest, by identifying its stakeholders and modeling the related Stakeholder Features.	Stakeholder Type	Classes of covered stakeholders (may be multiple)	X						X	X	X	X
	Modeled System External (Black Box) Behavior	The capability of the model to represent the objective external ("black box") technical behavior of the system, through significant interactions with its environment, based on modeled input-output exchanges through external interfaces, quantified by technical performance measures, and varying behavioral modes.			X					X			X	X
	Explanatory Decomposition	The capability of the model to represent the decomposition of its external technical behavior, as explanatory internal ("white box") internal interactions of decomposed roles, further quantified by internal technical performance measures, and varying internal behavioral modes.			X					X			X	
	Physical Architecture	The capability of the model to represent the physical architecture of the system of interest. This includes identification of its major physical components and their architectural relationships.			X					X			X	

# Model Scope and Content

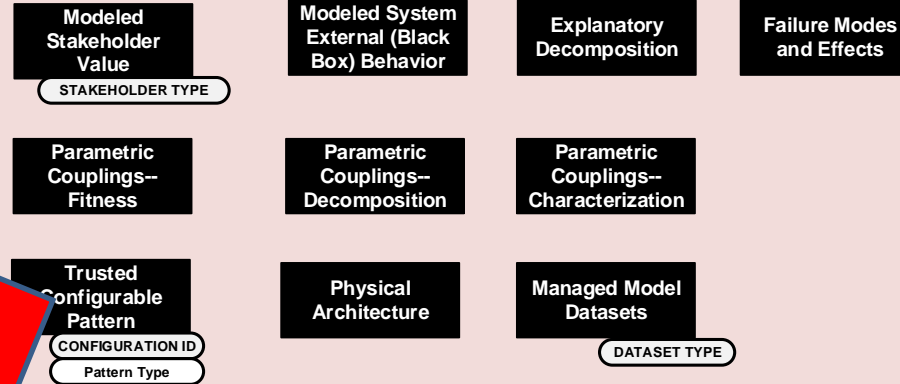

Feature Group	Feature Name	Feature Definition	Feature Attribute	Attribute Definition	Feature Stakeholder							Model Type	
					Model User	Model Developer	Model Maintainer	Mdl Deployer-Distributor	Model Use Supporter	Regulatory Authority	Mdl Investor-Owner	Physics Based	Data Driven
<b>Describes the scope of content of the model</b>													
	Parametric Couplings--Fitness	The capability of the model to represent quantitative (parametric) couplings between stakeholder-valued measures of effectiveness and objective external black box behavior performance measures.			X					X		X	X
	Parametric Couplings--Decomposition	The capability of the model to represent quantitative (parametric) couplings between objective external black box behavior variables and objective internal white box behavior variables.			X					X		X	X
	Parametric Couplings--Characterization	The capability of the model to represent quantitative (parametric) couplings between objective behavior variables and physical identity (material of construction, part or model number).			X					X		X	
	Managed Model Datasets	The capability of the model to include managed datasets for use as inputs, parametric characterizations, or outputs	Dataset Type	The type(s) of data sets (may be multiple)	X		X			X		X	X
	Trusted Configurable Pattern	The capability of the model to serve as a configurable pattern, representing different modeled system configurations across a common domain, spreading the cost of establishing trusted model frameworks across a community of applications and configurations.	Configuration ID	A specific system of interest configuration within the family that the pattern framework can represent.	X		X			X	X	X	X
			Pattern ID	The identifier of the trusted configurable pattern.	X		X				X	X	X
