

Topic

A **Topic** is the most basic description of data that is to be published and/or subscribed to. A topic connects a [Data Writer](#) with a [Data Reader](#), i.e., communication does not occur unless the topic published by a data writer matches a topic subscribed to by a data reader. Communication via topics is anonymous and transparent, i.e., publishers and subscribers need not be concerned with how topics are created or who is writing/reading them since the [Data Distribution Service \(DDS\) DCPS middleware](#) manages these issues. In programming terms, a Topic is a Class and each [instance](#) is a [Sample](#). Topic instances are associated with a [key](#) (similar to a packet ID), defined by [Interface Definition Language \(IDL\)](#) and a set of Quality of Service parameters.
