

2.2.2.2 Node View

[return to Node Network View](#)

The Node View represents the internals of any particular [node](#) within the [node network](#). As represented in the figure below, it is comprised of five layers; however, the layers are not set in stone – each implementation of a node within a domain may be organized differently.

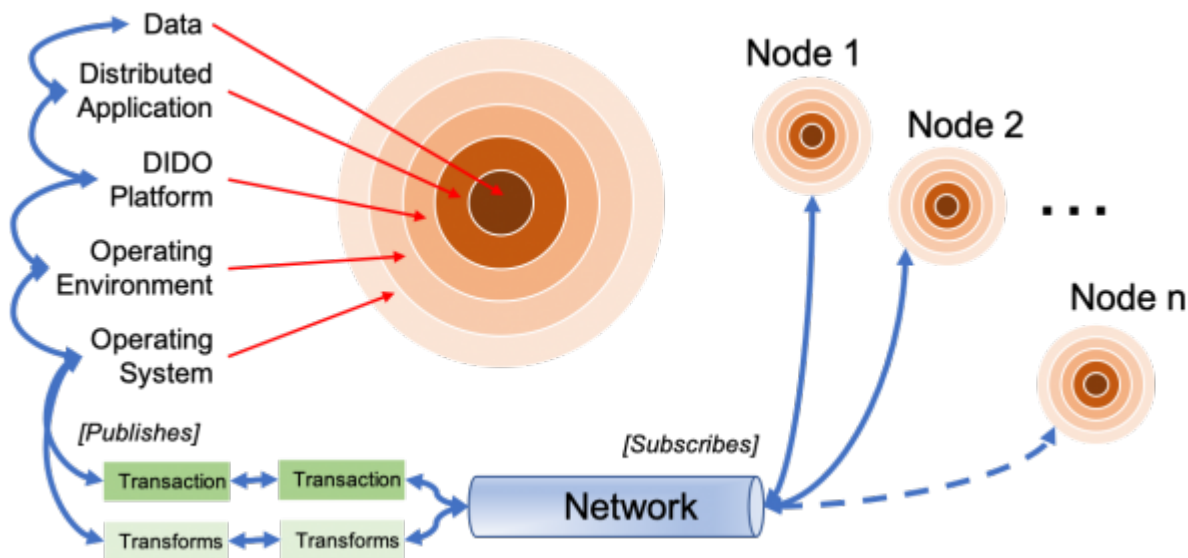

Figure 1: The idealized five layers of a Node.

At the boundary between each layer there is an interstitial layer formed by an [Application Programming Interface \(API\)](#), which is usually defined by one or more [technical](#) or [de facto](#) standards.

As each transaction, transform, or stream of data flows to or from a node over the network, it must travel through and/or interact with the:

- [2.2.2.2.1 Operating System \(OS\)](#)
- [2.2.2.2.2 Operating Environment](#)
- [2.2.2.2.3 DIDO Platform](#)
- [2.2.2.2.4 Distributed Applications](#)
