

2.3.2.5 Hybrid Networks

[return to Network Access Control](#)

Hybrid Blockchain is unique in that it is decentralized while also making it possible to restrict the visibility of information on the network with a combination of [Public](#), [Private](#), [Permissionless](#) and [Permissioned](#) Networks. Thus, a hybrid blockchain is appealing for regulated markets as it offers the benefits of public blockchain and private blockchain together.¹⁾

The Hybrid Blockchain's decentralized, secure, transparent and immutable nature provides benefits similar to those offered by [Permissionless](#) and [Public](#) networks: it allows for restrictions on rights to view, modify and append/approve transactions to approved participants. In simple words, if a network member does not want their transaction data to be visible or accessible without their permission, they can earmark particular rights to view, modify or get into consensus with different members.²⁾

Some benefits of Hybrid Networks

Private Transactions

Transaction are private but verifiable using the Ledger's immutable data objects (i.e., leverage its public state). In its public state, each transaction gets approved by a massive network and is essentially secure and trustworthy. Hence, there is no need for a central governing body or an exhaustive chain of intermediaries to supervise things. So, any change done to a transaction will undergo a “kindred” approval process, making it next to impossible for a single actor to meddle with the transaction or entries³⁾.

Equality

Everyone in the Network has equal rights to view, modify and append their consent to a transaction. In addition, the identity of transacting parties is never disclosed to all the visible network participants.⁴⁾

Non-Repudiation

Anonymity is simply not acceptable to financial institutions and regulated industries with their strict Know-Your-Customer (KYC) standards.⁵⁾

Confidentiality

Unrestricted visibility of the public state of the network exposes all the data to a colossal network breach, which is counter to data confidentiality obligations, as well as, their business concerns.⁶⁾

“If you Thought Blockchain was Amazing, Wait till You Read about Hybrid Blockchain”, Atul Khekade, 20 January 2018, <https://www.entrepreneur.com/article/307794>. This article uses the term “agnate approval” rather than “kindred approval”; however, [agnate](#) limits a [kindred](#) relationship to males only. Thus, we prefer the term “kindred” over “agnate”
