

# Aggregation Layer

[Return to Glossary](#)

**Aggregation Layer**, in [Decentralized Finance \(DeFi\)](#), consists of aggregators who connect various applications from the previous layer to provide a service to investors. For example, they might enable the seamless transfer of money between different financial instruments to maximize returns. In a physical setup, such trading actions would entail considerable paperwork and coordination. But a technology-based framework should smoothen the investing rails, allowing traders to [switch](#) between different services quickly. Lending and borrowing is an example of a service that exists on the aggregation layer. Banking services and crypto wallets are other examples.<sup>1)</sup>
