

# Application Binary Interface (ABI)

[Return to Glossary](#)

**Application Binary Interface (ABI)**, in computer software, is an [interface](#) between two binary program modules. Often, one of these modules is a library or operating system facility, and the other is a program that is being run by a user. An ABI defines how data structures or computational routines are accessed in machine code, which is a low-level, hardware-dependent format. In contrast, an [API](#) defines this access in source code, which is a relatively high-level, hardware-independent, often human-readable format.
