

# Communications Model

The **Communications Model** underlying the network [middleware](#) is the most important factor in how applications communicate. The communications model impacts the [performance](#), the ease to accomplish different communication transactions, the nature of detecting errors, and the robustness to different error conditions. Unfortunately, there is no “one size fits all” approach to [distributed applications](#). Different communications models are better suited to handle different classes of [application](#) domains.

We commonly discuss three main types of network communications models:

- [Point-to-Point](#)
- [Client-Server](#)
- [Publish-Subscribe](#)
