Decision Point

Return to Glossary

A **Decision Point** is a place in a program where the execution flow through the program is controlled. As a general rule, **Decision Points** occur at the Control Flow statements, however, the each boolean expression in the Control Flow statement is its own **Decision Point**.

Control flow graph where the control of the program diverges. Common examples include do-while statements, if statements, and case statements.

These statements are also referred to as control flow statements. Source: URI
