

# Graph DataBase (GDB)

[Return to Glossary](#)

A **Graph DataBase** is a NoSQL-type [Database](#) system based on a topographical network structure. The idea stems from graph theory in mathematics, where graphs represent data sets using nodes, edges, and properties.

- **Nodes** or points are instances or entities of data which represent any object to be tracked, such as people, accounts, locations, etc.
- **Edges** or lines are the critical concepts in graph databases which represent relationships between nodes. The connections have a direction that is either unidirectional (one way) or bidirectional (two way).
- **Properties** represent descriptive information associated with nodes. In some cases, edges have properties as well.
