

Liveliness QoS

[See Policy](#) or [Return to Glossary](#)

Liveliness QoS offers the following settings to detect failures on the publishing node:

- **AUTOMATIC**

Infrastructure managed (default), leases are renewed automatically by the service. Only process failures can be detected this way.

- **MANUAL_BY_PARTICIPANT**

Application managed, the entire [Domain Participant](#) renews its lease when one of its contained Entities asserts its liveliness, either explicitly or implicitly.

- **MANUAL_BY_TOPIC**

Application managed, each [Data Writer](#) is responsible for renewing its own lease, either implicitly or explicitly.
