

Multi-core Processor

[Return to Glossary](#)

A **Multi-core Processor** is an integrated circuit (IC) to which two or more [processors](#) have been attached for enhanced [performance](#), reduced power consumption, and more efficient simultaneous processing of multiple tasks (see [parallel processing](#)). A dual core set-up is somewhat comparable to having multiple, separate processors installed in the same computer, but because the two processors are actually plugged into the same socket, the connection between them is faster. ¹⁾
