

Permissioned Ledger

[Return to Glossary](#)

Permissioned Ledger is a ledger where actors must have permission to access the ledger. Permissioned ledgers may have one or many owners. When a new record is added, the ledger's integrity is checked by a limited [consensus process](#). This is carried out by trusted actors—government departments or banks, for example—which makes maintaining a shared record much simpler than the consensus process used by unpermissioned ledgers.
