

Stream Control Transmission Protocol (SCTP)

[Return to Glossary](#)

The **Stream Control Transmission Protocol (SCTP)** is a computer networking communications protocol in the Transport Layer of the Internet Protocol Suite. Originally intended for Signaling System 7 (SS7) message transport in telecommunication, the protocol provides the message-oriented feature of the [User Datagram Protocol \(UDP\)](#), while ensuring reliable, in-sequence transport of messages with congestion control like the [Transmission Control Protocol \(TCP\)](#). Unlike UDP and TCP, the protocol provides multi-homing and redundant paths to increase resilience and reliability. SCTP is standardized by the [ietf](#) in RFC 4960. The SCTP reference implementation was released as part of FreeBSD version 7, and has since been widely ported to other platforms.
