

Secure Sockets Layer (SSL)

[Return to Glossary](#)

Secure Sockets Layer (SSL) is a standard [Protocol](#) used for the secure transmission of documents over a network. Developed by Netscape, SSL technology creates a secure link between a Web [Server](#) and browser (i.e., [Client](#) to ensure private and integral data transmission. SSL uses [Transmission Control Protocol \(TCP\)](#) for communication.

- **Note:** SSL is deprecated in favor of [tsl](#)
