

Tangle

[Return to Glossary](#)

Tangle is the moniker used to describe IOTA's [Directed Acyclic Graph \(DAG\)](#) based transaction settlement and data integrity layer focused on the [internet_of_things_iot](#). The Tangle is essentially a string of individual transactions that are interlinked to each other and stored through a decentralized network of node participants.

Importantly, the Tangle does not have miners as users of the network function as the miners themselves through performing small computational [Proof of Work \(PoW\)](#) for each transaction by verifying previous transactions submitted to the network. Focused on allowing the network to scale for a global micropayment network of interconnected IoT devices, The Tangle is designed to offer a solution to the heterogeneous nature of current blockchain systems.
