## Abstract

IEC 62541-10:2020 defines the information model associated with Programs in the OPC Unified Architecture. This includes the description of the NodeClasses, standard Properties, Methods and Events and associated behaviour and information for Programs. The complete Address Space model including all NodeClasses and Attributes is specified in IEC 62541-3. The Services such as those used to invoke the Methods used to manage Programs are specified in IEC 62541 4. This third edition cancels and replaces the second edition published in 2015.

This edition includes several clarifications and in addition the following significant technical changes with respect to the previous edition:

- a) Changed **ProgramType** to **ProgramStateMachineType**. This is in line with the **NodeSet** (and thus implementations). In **ProgramDiagnosticDataType**: changed the definition of **LastInputArguments** and **LastOutputArguments** and added two additional fields for the argument values. Also changed **StatusResult** into **StatusCode**. Created new version of the type to ProgramDiagnostic2DataType.
- b) Changed Optional modelling rule to **OptionalPlaceHolder** for Program control Methods. Following the clarification in IEC 62541-3, this now allows subtypes (or instances) to add arguments.
