

# Non-Functional Requirements

[Return to Glossary](#)

**Non-Functional Requirements** specify how the system should do it. Non-functional requirements do not affect the basic functionality of the system (hence the name, non-functional requirements). Even if the non-functional requirements are not met, the system will still perform its basic purpose.

If a system will still perform without meeting the non-functional requirements, why are they important? The answer is [usability](#). Non-functional requirements define system behavior, features, and general characteristics that affect the user experience. How well non-functional requirements are defined and executed determines how easy the system is to use, and is used to judge system [performance](#). Non-functional requirements are product properties and focus on user expectations.

See also [Functional Requirements](#).
