Sanity Testing

[Return to Glossary](#)

Sanity Testing is a subset of [regression testing](#). Sanity testing is performed to ensure that the code changes that are made are working as properly. Sanity testing is a stoppage to check whether testing for the build can proceed or not. The focus of the team during sanity testing process is to validate the functionality of the [application](#) and not detailed testing. Sanity testing is generally performed on build where the production deployment is required immediately like a critical bug fix.
